Acupuncture Point Selector MCP

Clinical decision support for Traditional Chinese Medicine practitioners.

Acupuncture Point Selector MCP helps you bridge TCM diagnostic patterns with precise clinical application. Your AI client can identify synergistic point formulas, calculate needle depth and retention times, plan treatment schedules, and run safety checks against patient profiles like pregnancy status to ensure safe, effective practice.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Acupuncture Point Selector MCP

4 tools available

Cloud-hosted on Vinkius

You can use this MCP to bring deep Traditional Chinese Medicine knowledge directly into your AI-powered clinical workflow. Instead of manually cross-referencing texts for point combinations, you can ask your agent to find the right formula for a specific symptom pattern. It handles the heavy lifting of clinical logic, such as identifying synergistic points for specific diagnoses. Once you have a formula, the MCP provides the technical details you need for administration, including how deep to needle and how long to leave the needles in place. It also helps you manage the logistics of a treatment plan by suggesting how often a patient should return. Most importantly, it acts as a safety layer. You can quickly check if a proposed set of points is contraindicated for a patient, such as someone who is pregnant, before you begin treatment. It's a technical companion for practitioners who want to verify their clinical reasoning with a specialized tool.

Core Capabilities

01 — Formula Selection

Your agent identifies optimal acupuncture point sets based on TCM diagnostic patterns.

02 — Technical Administration

The AI provides specific needle depth and retention time data for selected points.

03 — Treatment Planning

Your agent calculates the necessary frequency and total sessions for a treatment course.

04 — Safety Verification

The tool checks point combinations against patient profiles to prevent contraindications.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/en/ai-agent-connect/acupuncture-point-selector — connect your AI agent in three steps.

- 01 Connect your AI client to Vinkius to access the MCP.
- 02 Describe the patient's symptoms and TCM diagnosis to your agent.
- 03 The agent uses the MCP to find formulas, schedules, or safety data.
- 04 Review the technical parameters or safety warnings provided by the tool.

You connect the MCP to your preferred AI client and start asking clinical questions immediately.

Built For

This MCP is built for practitioners of Traditional Chinese Medicine who want to augment their clinical decision-making with an intelligent technical assistant.

Acupuncturists

Use the tool to verify point formulas and needle parameters during patient consultations.

TCM Practitioners

Hand off diagnostic pattern analysis to the AI to find synergistic point combinations.

Clinical Researchers

Use the tool to model treatment schedules and safety profiles for specific conditions.

What Changes When You Connect

- 01 Reduces manual lookup time for point formulas and technical parameters.
- 02 Adds a safety check layer for contraindicated points in sensitive patient profiles.

-
- | | |
|----|---|
| 03 | Standardizes treatment scheduling based on clinical presentation. |
| 04 | Provides precise physical administration data for needle placement. |
-

Real-World Applications

Acute Pain Management

Identify specific point formulas for patients presenting with sudden onset pain and specific Qi patterns.

Pregnancy Safety Checks

Verify that a chosen point combination does not include contraindications for pregnant patients.

Chronic Condition Planning

Determine the total number of sessions and weekly frequency needed for long-term regulation.

Needle Administration

Get exact depth and retention instructions for a specific set of points to ensure consistent technique.

Patterns to Avoid

Ignoring patient safety profiles

❌ AVOID

You pick a point set for a patient with acute pain without checking their pregnancy status first.

✓ INSTEAD

Always run your proposed points through ``validate_point_safety`` to catch contraindications before you start the session.

Guessing needle depth

❌ AVOID

You rely on memory for how deep to needle a specific point on a patient with a different body type.

✓ INSTEAD

Use ``get_needling_parameters`` to get the exact depth and retention times required for the points you selected.

Manual scheduling math

❌ AVOID

You spend time manually calculating how many weeks a patient needs to return for a chronic condition.

✓ INSTEAD

Let the agent handle the logistics by using ``get_treatment_schedule`` to determine the total sessions and frequency.

The Right Fit

TCM practitioners and clinical researchers should connect this MCP to augment their decision-making. If you are a generalist practitioner who does not use TCM diagnostic patterns, this tool won't be useful to you. The decision comes down to whether you want to automate the technical parameters and safety checks of your clinical logic.

Acupuncture Point Selector: 4 Clinical Tools

These tools handle the technical heavy lifting of TCM, from point selection to needle administration and safety checks.

#	TOOL	DESCRIPTION
01	get_needling_parameters	This tool provides technical administration data. It tells you the specific needle depth and retention times for a chosen set of points.
02	get_treatment_schedule	This tool determines the recommended frequency and duration for a treatment course. It helps you plan how many sessions a patient needs.
03	select_point_formula	This tool finds the best set of acupuncture points for a specific clinical presentation. It identifies synergistic combinations based on the patient's symptoms.
04	validate_point_safety	This tool checks if a point combination is safe for a specific patient. It flags contraindications like pregnancy status.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Find a point formula for a patient with acute lower back pain and Liver Qi Stagnation for pain relief.

The recommended points for acute lower back pain with Liver Qi Stagnation are BL23, BL40, and LV3. These points work together to regulate Qi flow and alleviate local tension.

U What is the recommended treatment schedule for a chronic headache condition?

For chronic headache conditions, the recommended schedule is 2 sessions per week for a total of 10 sessions to achieve long-term regulation.

U Is the combination of LI4 and LV3 safe for a pregnant patient?

No, the combination is not safe. LI4 is strictly contraindicated during pregnancy.

Frequently Asked Questions

01 How do I use this MCP with Claude?

You connect to the MCP through the Vinkius platform. Once connected, your Claude client can immediately use the tools to assist with TCM diagnosis and planning.

02 Can this tool help with pregnancy safety?

Yes. The `validate_point_safety` tool checks if specific point combinations are contraindicated for patients, such as those who are pregnant.

03 Does it provide specific needle depths?

Yes. The `get_needling_parameters` tool provides technical physical administration data, including depth and retention times.

04 Can it help plan a multi-week treatment plan?

Yes. The `get_treatment_schedule` tool determines the recommended frequency and duration for a full course of treatment.

05 Do I need to host this myself?

No. Vinkius hosts and manages the MCP for you. You just connect your client and start working.
