Airport Transfer Cost Calculator MCP

Get exact trip pricing and service area checks instantly.

Airport Transfer Cost Calculator MCP handles the math for transportation logistics. Your AI agent uses it to calculate specific trip prices, check if a destination is within service limits, and compare different pricing tiers like Economy or Premium. It's built to turn distance and base fare data into clear, actionable cost estimates.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Airport Transfer Cost Calculator MCP

4 tools available

Cloud-hosted on Vinkius

You can stop manually calculating mileage and base rates for airport trips. This MCP gives your AI client a dedicated engine to handle transportation math. When you're planning routes, your agent can use it to find the final price for a specific trip or check if a requested distance actually falls within a provider's service area. If you need to plan for multiple trips or different distance tiers, the MCP provides bulk estimates to keep your planning accurate. You can also run side-by-side comparisons between different service levels, such as comparing an Economy rate against a Premium rate for the same distance. It's a direct way to bring precise logistics pricing into your AI-driven workflows.

Core Capabilities

01 — Trip Cost Calculation

Your agent calculates exact totals using base fares and distance rates.

02 — Service Area Validation

The AI checks if a destination is reachable within set distance limits.

03 — Tier Comparison

Your agent evaluates the price difference between different service levels.

04 — Bulk Planning

The MCP provides cost ranges for multiple distance tiers simultaneously.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/en/ai-agent-connect/airport-transfer-cost-calculator — connect your AI agent in three steps.

- 01 Connect your AI client to the Vinkius hosted MCP.
- 02 Provide the trip distance and fare details to your agent.
- 03 The agent calls the specific tool needed for the calculation.
- 04 The MCP returns the precise cost or feasibility status.
- 05 Your agent delivers the final answer to you.

Connecting this MCP to your AI client gives your agent immediate access to transportation math tools.

Built For

This MCP is for professionals managing ground transportation or travel logistics. It moves the math from manual spreadsheets to your AI agent.

Logistics Coordinators

They hand off distance and fare data to the AI to generate quick quotes.

Travel Agents

They use the agent to compare different vehicle tiers for clients.

Fleet Managers

They use the tool to validate if new routes are within their service radius.

What Changes When You Connect

- 01 Eliminates manual math for distance-based pricing.
- 02 Prevents errors by validating service area limits.

03 Speeds up comparisons between different service tiers.

04 Provides consistent pricing logic for your AI agent.

Real-World Applications

Instant Client Quotes

Your agent calculates a specific trip price for a customer in seconds.

Service Boundary Checks

The AI verifies if a pickup location is too far for the current fleet.

Tiered Service Selection

You compare Economy and Premium costs to help a user choose a ride.

Route Planning

The agent uses bulk estimates to plan costs for multiple trip distances.

Patterns to Avoid

Manual pricing guesswork

❌ AVOID

You ask your agent to estimate a trip cost based on general knowledge of local taxi rates.

✓ INSTEAD

Use `get_transfer_cost` to get a precise total based on actual base fares and distance rates.

Ignoring service boundaries

❌ AVOID

Your agent accepts a booking for a destination that is 100 miles away when your fleet only covers 50 miles.

✓ INSTEAD

Always run `validate_trip_feasibility` first to ensure the distance stays within your service area.

Single tier focus

❌ AVOID

You only provide one price to a client and miss the chance to offer a higher service level.

✓ INSTEAD

Run `compare_service_tiers` to show the client the price gap between Economy and Premium options.

The Right Fit

Logistics coordinators and travel agents should connect this MCP if they need to automate trip pricing. If you are just curious about general travel costs without specific distance or tier data, you don't need this.

Airport Transfer Cost Calculator: 4 Precision Tools

These tools handle the heavy lifting for transportation math, from single trip quotes to bulk distance tiering.

#	TOOL	DESCRIPTION
01	compare_service_tiers	This tool compares two different pricing structures for the same distance. It helps you see the cost difference between service levels like Economy and Premium.
02	get_bulk_pricing_estimate	This tool provides a range of costs across different distance tiers. Use it to plan for various trip lengths at once.
03	get_transfer_cost	This tool calculates the final price for a specific trip. It factors in base fares and distance rates to give you a single total.
04	validate_trip_feasibility	This tool checks if a requested distance is within the service area's capabilities. It prevents your agent from booking trips that are too far away.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U What is the cost for a 25km trip with a \$10 base fare and \$2 per km rate?

The total cost for the 25km trip is \$60.

U Is a 50km trip possible if the maximum service radius is 40km?

No, the trip is not feasible as it exceeds the maximum service radius.

U Compare an Economy tier (\$5 base, \$1.5/km) with a Premium tier (\$20 base, \$3/km) for a 10km trip.

The Economy tier costs \$20 and the Premium tier costs \$50. The Economy tier is cheaper.

Frequently Asked Questions

01 How does the MCP calculate trip costs?

It uses a calculation engine that combines base fares with specific rates per kilometer.

02 Can I check if a trip is too long for a service provider?

Yes, the `validate_trip_feasibility` tool checks if a distance is within the allowed service area.

03 Can I compare different vehicle classes?

Yes, the `compare_service_tiers` tool lets you see the price difference between different pricing models for the same distance.

04 Does this work with any AI client?

It works with any MCP-compatible client like Claude, Cursor, or Windsurf.

05 Do I need to host this myself?

No, Vinkius hosts and manages the MCP so it is ready to use immediately after you connect.

06 How is the total transfer cost calculated?

The total cost is the sum of the fixed base fare and the product of the total distance and the rate per kilometer.

07 Can I check if a driver can reach my location?

Yes, you can use the `validate\_trip\_feasibility` tool to check if a requested distance is within the provider's maximum service radius.

08 How do I compare different vehicle tiers?

You can use `compare\_service\_tiers` to compare the total cost of two different pricing structures for the same distance.
