Asana MCP for AI Agents

Manage project tasks and track sprint progress directly through your AI client.

Asana MCP connects your project management data to your AI agent. It lets you query projects, manage tasks, and inspect board sections directly from any AI client like Claude or Cursor. Instead of jumping between tabs, you can ask your agent to find specific tickets, check who is assigned to what, or update task statuses in real-time. It's the fastest way to keep your team's project tracking and sprint planning synchronized with your actual work.

A+ Quality Score 100/100

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Get started at cloud.vinkius.com — connect your AI agent in under 60 seconds.

Asana MCP

15 tools available

Cloud-hosted on Vinkius

This Asana MCP connects your project management data to your AI agent. Imagine you're in the middle of a coding session and need to know if the API refactor is finished. Usually, you'd have to leave your IDE, open a browser tab, and hunt through a messy project board to find the right ticket. This changes that. By connecting your Asana account to your AI client, you turn your agent into a project management expert that lives where you work. You can ask about specific task statuses, find out who's blocked on a sprint, or see what's in the "In Progress" column without moving your mouse or losing your train of thought. It handles the heavy lifting of navigating complex hierarchies, so you can stay in your flow. Whether you're a product manager trying to spot stale tickets or an engineer wanting to see task descriptions while you write code, this tool makes the data accessible. It's one of the many high-quality integrations you can find on the Vinkius marketplace to bridge the gap between your data and your AI. You get a direct line to your team's progress, making it easier to stay aligned on what actually needs to happen next. You can pull up project overviews, check assignee details, and manage task comments through a simple conversation. It removes the friction of manual updates and gives you a clear view of the work ahead.

Core Capabilities

01 — Query project tasks

Ask your agent to find specific tickets and get their details immediately.

03 — Update task statuses

Change the state of a project item through a simple chat command.

02 — Inspect board sections

See how your sprint is organized across different columns and stages.

04 — Manage task comments

Add notes or updates to specific items without opening the web app.

05 — Search for specific tasks

Filter through your entire workspace to find exactly what you need.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/asana — connect your AI agent in three steps.

- 01

Subscribe to this MCP and get your Personal Access Token from your Asana settings.
- 02

Paste the token into your AI client's configuration to link your account.
- 03

Ask your agent to list projects, check task statuses, or update records in real-time.

The bottom line is you get a way to talk to your Asana data instead of clicking through it.

Built For

This is for the project lead who's tired of context switching and the developer who needs to see task requirements without leaving their editor.

Product Manager	Engineering Lead	Agency Owner
Checks project statuses and pulls task descriptions during planning meetings without leaving the chat.	Monitors sprint progress and identifies blockers across multiple teams by querying workspace data.	Queries client workspaces to keep track of cross-functional deliverables and team capacity.

What Changes When You Connect

- 01

Stop context switching by checking task statuses directly in your AI client or code editor using `get_task`.
- 02

Quickly identify blockers by using `search_tasks` to find stale items across multiple projects in seconds.
- 03

Keep your sprint board clean by using `delete_task` and `update_task` to manage the lifecycle of your work.

-
- | | |
|-----------|---|
| 04 | Stay updated on team discussions by pulling <code>list_stories</code> to see the latest activity on a specific ticket. |
| <hr/> | |
| 05 | Speed up planning by using <code>list_sections</code> to understand the current workflow structure of any project. |
| <hr/> | |
| 06 | Get immediate access to task metadata and descriptions with <code>get_task</code> to keep your work accurate and visible. |
-

Real-World Applications

Checking requirements while coding

A developer wants to see the requirements for a ticket while coding. They ask their agent to fetch the description for a specific task GID.

Quick sprint status checks

A PM needs to know what's in the Testing column. They ask the agent to list sections and then list tasks for that project.

Cross-client project overviews

An agency lead wants to see all active projects for a client. They ask the agent to list workspaces and then list projects.

Adding rapid updates

A team member needs to add a quick update to a task. They tell the agent to add a comment to the task about a minor bug fix.

Patterns to Avoid

Bulk migration via chat

X AVOID

Asking the agent to move 50 tasks between projects in one prompt.

✓ INSTEAD

Use `list_tasks` to identify the items first, then use `update_task` to move them in smaller, manageable batches to ensure accuracy.

Deleting active tickets

X AVOID

Using `delete_task` on a project that still has active stories or comments.

✓ INSTEAD

Use `list_stories` first to ensure no critical information is lost before using `delete_task` to clean up your board.

Vague workspace searches

X AVOID

Asking the agent 'what are the tasks?' in a massive organization.

✓ INSTEAD

Use `search_tasks` with specific filters like status or assignee to get the exact results you need without scrolling through noise.

The Right Fit

Use this if you need to bridge Asana with your AI tools for project tracking. It is perfect for getting task details, listing projects, and updating statuses through natural language. It helps you stay in your flow by making project data accessible. Don't use it if you need to perform complex bulk operations like moving hundreds of tasks between projects in one go, or if you need to manage deep permissions. For heavy-duty data migrations or complex automation logic that requires multi-step branching, a custom script or a dedicated integration platform might be better.

Asana MCP for Project Management Task Tracking

Managing a project usually means jumping between your code editor, your chat app, and a dozen browser tabs just to see if a task is finished. You spend half your day copy-pasting status updates and hunting for ticket descriptions buried in long threads.

This MCP changes that by bringing your project data directly into your AI client. You can ask about a ticket's status or see what's in the next sprint without ever leaving your workspace. You get a clear view of your work and a way to keep it updated in real-time.

Asana MCP for Agile Sprint Planning Automation

Stop wasting time manually checking board sections or searching for stale tasks. You can now query your entire workspace to find specific items, pull up assignee details, and manage task comments through simple conversation.

It removes the friction of manual updates and gives you a clear view of the work ahead. You stay aligned with your team and keep your projects moving forward.

Asana 15 Project Management Tools

Manage tasks, query projects, and update statuses across your Asana workspace using your AI agent.

#	TOOL	DESCRIPTION
01	create_task	Create a new task in a specific Asana project. Use this to quickly add items as they come up in conversation.
02	get_task	Fetch the details of a specific task. This helps you see descriptions and status metrics for a single item.
03	list_stories	View the activity feed for a task. It's great for seeing the history of updates on a specific ticket.
04	list_tags	See all tags within a workspace. Use this to understand how your team categorizes different types of work.
05	get_me	Retrieve the details of the current user. This confirms which account the agent is currently using.
06	list_projects	List all projects in a workspace. This helps you get a high-level view of all active work.
07	search_tasks	Search for tasks using filters. Use this to find specific items across your entire organizational workspace.
08	list_sections	List the sections inside a project. This shows you how your board columns and stages are organized.
09	list_tasks	List all tasks in a project. Use this to get a quick overview of every item in a specific project.
10	update_task	Update an existing task's details. This lets you change statuses or descriptions via the agent.
11	list_workspaces	List all workspaces. Use this to see the different environments your account has access to.
12	add_task_comment	Add a comment to a task. This lets you leave notes or updates on a ticket quickly.
13	delete_task	Permanently delete a task. Use this to clean up your project board when work is finished.
14	get_user	Get details for a specific user. This helps you find out who is assigned to what or find team member info.

#	TOOL	DESCRIPTION
15	list_portfolios	List portfolios in a workspace. Use this to see how large groups of projects are organized.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U What's the status of the login fix?

Task Status: Login Fix

TASK NAME	STATUS	ASSIGNEE
Fix Login Bug	 In Progress	Marcus R.
Update Auth Layer	 Completed	Sarah K.

Notes: The login fix is currently being tested. Marcus mentioned a small delay with the API response.

U Show me what's in the 'In Progress' section of the Mobile App project.

I've pulled the tasks for the **Mobile App** project currently in the **In Progress** section:

- **Refactor API Auth Layer** (Assigned to: David L.)
- **Fix Webhook Timeout Payload** (Assigned to: Elena W.)
- **Update UI for Login Screen** (Assigned to: Marcus R.)

U Who is working on the API migration?

I found 3 team members currently assigned to tasks related to the **API Migration**:

David L. - Working on Refactor API Auth Layer*

Elena W. - Working on Fix Webhook Timeout Payload*

Sarah K. - Completed Update Auth Layer*

Frequently Asked Questions

01 How does the Asana MCP help my project management?

It allows your AI agent to read and write to your Asana projects. You can ask for status updates, find specific tasks, and manage your board without leaving your current app.

02 Can I use the Asana MCP to update task statuses?

Yes. You can tell your AI agent to update a task's status, description, or other fields using natural language, and it will sync with Asana automatically.

03 Does the Asana MCP work with Cursor or Claude?

Yes, it works with any MCP-compatible client, including Claude, Cursor, and Windsurf, giving you project data directly in your editor or chat.

04 Can my AI agent see who is assigned to a task?

Yes. The MCP allows the agent to retrieve assignee details and user profiles, so you can quickly see who is responsible for what.

05 Is it easy to set up the Asana MCP?

It is very simple. You just need to subscribe, get your Personal Access Token from Asana, and paste it into your AI client's configuration.

06 Can I search for tasks across my whole workspace?

Yes. You can ask your agent to find specific tasks using filters across your entire workspace, making it easy to locate old tickets or specific project items.

07 Can my AI automatically find the details and status of a specific task just by providing the Task GID?

Yes! Use the `get\_task` tool with exactly the Task Global ID. Your agent will respond with complete metadata, assignee fields, and precise operational notes connected to that active ticket in seconds.

08 How do I easily list all the columns in an active agile sprint board?

Simply ask the agent to run the `list\_sections` action on the target Project GID. It will compile all column phases (e.g., 'To Do', 'In Progress', 'QA') configured for that environment.

09 Does the integration permit modifying or deleting my workspace configurations?

No. The core set of tools focuses strictly on heavily querying and analyzing context—listing projects, analyzing metadata, checking tasks. State alteration operations are not currently exposed, assuring your workspaces are secure against destructive queries.
