

MCP SERVER

NO CODE

CLOUD HOSTED

Attio MCP for AI Agents

Managing Sales Pipelines and Relationship Data

Attio brings powerful CRM data management capabilities to your AI client. Stop navigating complex dashboards; instead, talk naturally to your agent about people, companies, or deals. It lets you check account health, query relationships across different tables, and update records instantly using simple conversation.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Attio MCP

9 tools available

Cloud-hosted on Vinkius

Managing a sales pipeline usually means clicking through multiple tabs just to find one piece of data—a company's last contact email, the status of a deal, or how it relates to another client. This MCP changes that. It gives your AI agent direct access to Attio's entire database structure, meaning you can talk about what you need instead of where to find it.

You can ask your agent to list every data object in your workspace, check the details for a specific company record, or even perform fuzzy searches across multiple objects at once. If you know a lead's email and want to update their status without finding their profile first, the MCP handles that automatically. This deep integration means your AI client doesn't just read data; it writes it back into place. With Vinkius managing the connection, you get one consistent point of access for all your core relationship data, letting your agent work with the fidelity of a power user who never leaves their desk.

Core Capabilities

01 — Structure Data Objects

List every available data object (like 'People' or 'Companies') and retrieve detailed metadata about any specific entity.

03 — Manage Relationship Records

Create brand new records for any object type, or automatically update existing ones if they match unique identifiers like an email address.

02 — Find Specific Records

Perform global searches across all objects, or query and filter records within a single object using natural language criteria.

04 — Inspect Data Fields

Check which attributes (columns) are available on any given object to understand exactly what data can be captured there.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/attio — connect your AI agent in three steps.

- 01 First, your AI client uses the MCP to list all primary objects in the Attio workspace. This tells it where to look for the information you need.
- 02 Next, you ask your agent to perform an action, like finding a deal or creating a new contact. The agent then queries the relevant object and gathers the required data points.
- 03 Finally, if you want the AI to change something—like updating a company's address or marking a lead as 'Qualified'—it sends the necessary update command back through the MCP.

The bottom line is your agent handles the complex backend logic of data retrieval and modification so you don't have to think about tables, IDs, or API calls.

Built For

This MCP is for anyone whose job revolves around managing structured relationship data. If your workday involves switching between tabs to pull up a person's history, checking the status of a deal, or adding notes about a company, this tool saves you time and clicks.

Account Manager

Uses the MCP to quickly retrieve a client's full relationship history and pull up specific company attributes without manual dashboard navigation.

Sales Development Rep (SDR)

Relies on the tool to programmatically assert records from new leads, ensuring every potential contact is entered correctly and immediately available for follow-up.

Marketing Ops Specialist

Uses the MCP to enrich CRM data by querying company information or listing all objects to ensure marketing automation tools are feeding into the correct fields.

What Changes When You Connect

-
- 01 Stop wasting time clicking through tabs. Instead, just ask your agent to perform a search across all objects using `search_records` and get an instant list of matches.

 - 02 You never have to manually enter data again. Use the `assert_record` tool to automatically create or update records based on unique identifiers like email addresses in one prompt.

 - 03 Get immediate insight into your entire CRM structure. You can use `list_objects` first, then check object details with `get_object`, all within a single workflow.

 - 04 Need to know what data points are available? The `list_attributes` tool instantly shows you every field (column) on any given object, letting you map your data without guesswork.

 - 05 Eliminate manual status updates. Your agent can run complex queries using `query_records` and update the deal stage or company notes based purely on conversation context.
-

Real-World Applications

A prospect needs immediate follow-up details

Instead of searching five different tabs, you ask your agent to search for 'Acme Corp' and any related contacts. The agent uses ``search_records`` to find the company object and returns all associated people records in one go.

Understanding data requirements for a report

You ask your agent, 'What fields are available on Deals?' The tool uses ``list_attributes`` to return all columns (like Stage and Amount), letting you build your required report structure instantly.

A new lead needs immediate entry into CRM

You provide a name, email, and initial deal amount. Your agent runs ``assert_record``, which safely creates or updates the person record and links it to a new company object without you needing to know the IDs.

Finding historical data across multiple projects

You need records for a specific client that might be under 'People' or 'Companies'. Your agent uses ``query_records`` on both objects and consolidates the results, giving you a complete view of the relationship.

Patterns to Avoid

Trying to update data without matching IDs

X AVOID

You try to manually send an update prompt that just says 'Update John Doe's phone number.' The system fails because it doesn't know which John Doe you mean.

✓ INSTEAD

Don't rely on vague commands. Use ``assert_record`` and provide a unique identifier, like the email address or company ID, so the agent knows exactly which record to modify.

Getting stuck on where data lives

X AVOID

You can't find the 'Revenue' field. You waste time checking People records when it actually belongs in the Company object.

✓ INSTEAD

Before trying anything, use ``list_objects`` to see all available tables. Then, check that specific table using ``get_object`` and ``list_attributes`` to confirm the correct data structure.

Over-filtering on initial search

X AVOID

You try to build a complex query with too many AND/OR conditions at once, which can slow down or fail entirely.

✓ INSTEAD

Start broad. Use the ``search_records`` tool first to find all potential matches across objects. Then, narrow your focus using ``query_records`` on one specific object.

The Right Fit

Use this MCP if your core workflow involves constantly cross-referencing structured business data—specifically linking people, companies, and deals together. If you need to programmatically check an account's current status or update records based on external inputs (like a new email list), this is what you use. Don't use it if you simply need to read unstructured notes or general chat history; for that, a simple document retrieval tool suffices.

Conversely, don't rely solely on its `get_record` function, because while useful, remember to first check the object structure using `list_attributes` so your agent knows what data points are even possible.

Attio MCP for AI Agents: Managing CRM Relationships

Right now, updating a client profile is a multi-step chore. You might start in the 'People' tab to find the contact, copy their email into your notes, then switch over to the 'Company' object just to verify the address, and finally go to 'Deals' to mark them as 'Next Steps.' It takes dozens of clicks and context switching.

With this MCP, you tell your agent what needs to happen. You say, 'Update Jane Doe's contact info and set her company deal stage to Qualified.' The agent handles the entire process—it locates the right records, verifies the data structure, and makes all the necessary changes automatically. What you get is a single, accurate update with zero manual clicks.

Attio MCP for AI Agents: Querying Sales Pipelines

Before this tool, finding out which deals were created last quarter but never moved off 'Discovery' was a painful filter combination. You had to navigate the Deals object, set multiple date filters, and then manually check the Stage dropdown for every single record.

Now, you just ask your agent: 'Show me all deals that are stuck in Discovery since Q1.' The MCP runs a precise `query_records` against the entire Deal object and gives you only the relevant records. It's instant and accurate.

9 Tools Available

#	TOOL	DESCRIPTION
01	<code>assert_record</code>	Automatically creates a record if it doesn't exist, or updates it if you provide enough matching details (like an email address).
02	<code>create_record</code>	Creates an entirely new record within any specific object in the Attio workspace.
03	<code>get_account_check</code>	Verifies that your current connection to the Attio account is active and working correctly.
04	<code>get_object</code>	Fetches detailed metadata for a single, named data object (table) in the workspace.
05	<code>get_record</code>	Retrieves all available information for one specific record, provided you know its unique ID number.
06	<code>list_attributes</code>	Lists every single field or column name available on a chosen object to help map out your data structure.
07	<code>list_objects</code>	Generates a list of all major objects (tables) that exist within the Attio workspace.
08	<code>query_records</code>	Allows you to filter and search for records in a specific object based on defined criteria, like date range or status.
09	<code>search_records</code>	Performs a fuzzy, broad search across all objects simultaneously to find any relevant record instantly.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Find any companies named 'Acme' that have active deals.

Search Results for Acme:

- **Company:** Acme Corp (ID: 901)
Attributes:* Industry: Tech, Employees: 500, Status: Active
- **Company:** Acme Logistics (ID: 212)
Attributes:* Industry: Transport, Employees: 20, Status: Prospecting

Associated Deals Found:

COMPANY	DEAL NAME	STAGE	AMOUNT
Acme Corp	Q3 Enterprise Contract	Negotiation	\$1.2M
Acme Logistics	Initial Freight Quote	Discovery	\$45k

}
]

Frequently Asked Questions

01 How do I get my Attio Personal Access Token?

Log in to your Attio account, go to **Workspace Settings > Developers**, and you can create a new Personal Access Token (PAT) there.

02 What are 'Attributes' in Attio?

Attributes are the columns or fields on an object (e.g., Name, Email, Deal Value). You can list them using the `list_attributes` tool.

03 How does 'assert_record' work?

The 'assert_record' tool performs an 'upsert'. It checks if a record with a specific matching attribute (like an email address) already exists. If it does, it updates it; if not, it creates a new record.
