CLOUD HOSTED

Cabify MCP for AI Agents

Manage Corporate Travel and Expense Tracking in Spain and LATAM

Cabify MCP gives your AI agents full control over corporate mobility management. You can book rides, check real-time price estimates across different service tiers (Lite, Executive, Taxi), and track active trips directly through natural language commands. This is essential for travel managers needing centralized business expense tracking in Spain and LATAM.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Cabify MCP

9 tools available

Cloud-hosted on Vinkius

Managing employee transportation shouldn't feel like juggling ten different booking portals. This MCP connects your AI agent to the Cabify Business platform, giving you total control over corporate mobility from one place. Your agent can handle everything: comparing costs for a trip before you book it, requesting rides using simple text prompts, or pulling up detailed ride history for expense reports.

The system handles complex logistics like real-time traffic adjustments and service tier availability across multiple offices. Need to track a booked ride? It's there. Don't know where the driver is? Your agent tracks that live ETA. For companies with high monthly corporate travel, this saves massive amounts of manual work.

By connecting through Vinkius, your AI client gains immediate access to all these tools without needing any app navigation or complex API calls. You simply ask for what you need—a cost comparison, a booking confirmation, or expense data—and the agent executes it using natural conversation.

Core Capabilities

01 — Estimate costs and services

The MCP compares prices across all Cabify service tiers (Lite, Executive, Taxi) for any given route.

03 — Track expense history

The agent retrieves full ride records, including cost, product type, and origin/destination details for easy business expense compilation.

02 — Book and manage trips

You can request a new ride using coordinates or saved locations, track the trip's progress in real time, and cancel bookings if plans change.

04 — Manage destinations

You can save frequently used addresses like client offices or airports to quickly reference them when booking a trip.

05 – Determine travel timing

The system calculates estimated trip durations, factoring in current traffic conditions between any two points.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/cabify — connect your AI agent in three steps.

- 01** Connect your Cabify Business account using the API key from the official Cabify Empresas portal.
- 02** Ask your AI client to perform a mobility task, like 'What's the cost from the airport?' or 'Book me a ride for tomorrow morning.'
- 03** The agent uses the MCP tools to pull live data, book the trip, and provide a natural language summary of the results.

The bottom line is that you tell your AI client what you need—a cost estimate or a booking—and it handles all the underlying API calls for you.

Built For

This MCP is built for corporate environments. It's perfect for travel managers drowning in manual expense reports, executive assistants coordinating last-minute itineraries, and HR coordinators needing to manage employee transportation policies across multiple global sites.

Travel Manager

You use this to consolidate trip data from various sources, checking ride history for monthly expense summaries or comparing service tiers to ensure the company gets the best value.

Executive Assistant

You handle day-to-day booking requests, getting price estimates instantly and making last-minute adjustments by canceling or rescheduling trips based on a client's changing schedule.

HR Coordinator

You manage corporate policies, using the MCP to understand service availability across different regions (Spain/LATAM) for company travel guidelines.

What Changes When You Connect

-
- 01 Instead of manually checking multiple websites, you can get real-time cost comparisons by using `get_price_estimate` to compare rates across all service tiers.

 - 02 Eliminate endless searching for addresses. Use `add_saved_location` or `get_saved_locations` so your agent always references known business destinations instantly.

 - 03 When plans change, you don't waste time trying to find the cancellation portal; simply ask your agent to run `cancel_ride` and handle the necessary steps.

 - 04 Turn a disorganized pile of receipts into an actionable report. Running `get_ride_history` provides all the structured data needed for accurate business expense filing.

 - 05 Always plan ahead with certainty. The combination of `get_time_estimate` and checking available products ensures you book the right ride at the right time.
-

Real-World Applications

The quarterly budget review

A travel manager needs to reconcile all company spending from last quarter. Instead of downloading multiple spreadsheets, they ask their agent to run ``get_ride_history`` and compile a single summary showing total costs segmented by business expense category.

The meeting itinerary check

A field employee has a tight schedule. They use their agent to compare travel times between three different meetings using ``get_time_estimate``, ensuring the best route even with unexpected traffic delays.

The urgent client booking

An executive assistant needs to book a last-minute ride for a visiting client. They first use ``get_available_products`` to confirm the best service tier, then ask the agent to run ``get_price_estimate``, and finally execute ``request_ride``.

Handling last-minute changes

The client's meeting is canceled an hour before pickup. Instead of calling Cabify, they tell their agent to run ``cancel_ride`` immediately and confirm the cancellation status.

Patterns to Avoid

Mixing up expense data

X AVOID

Copying ride details from a physical receipt into an accounting spreadsheet, which is slow and prone to human error.

✓ INSTEAD

Let your agent run ``get_ride_history`` directly. It pulls all necessary fields—date, cost, category—into a structured format for immediate review.

Booking without checking costs

X AVOID

Requesting a ride immediately based on location alone, only to find out later the required service tier is too expensive.

✓ INSTEAD

Always ask your agent to run ``get_price_estimate`` first. This gives you immediate cost comparisons across different products before committing to a booking.

Manual location entry

X AVOID

Typing out the full address for an airport or frequently visited office every single time a ride is needed.

✓ INSTEAD

Use ``add_saved_location`` once. Then, your agent can reference that saved spot instantly when running any booking tool.

The Right Fit

You should use this MCP if your corporate mobility process relies heavily on structured data like trip history, cost comparison, and multi-step coordination (e.g., check price -> save location -> book ride). This is ideal for travel departments that manage recurring global expenses.

Don't use it if you only need basic information, such as finding a single address or checking general public service availability in a region. In those cases, a simple mapping tool might suffice. However, if the goal involves booking, tracking, or financial reconciliation, this MCP is necessary because it ties all operations together.

Remember: `get_ride_history` handles the expense data, but you still need to use `add_saved_location` first to make sure your agent can quickly access those high-frequency destinations during a booking.

Managing Cabify Corporate Travel and Expense Tracking with AI Agents

Today, managing company travel involves a painful mix of processes. You're clicking through the corporate portal to check available products; then you switch tabs to manually estimate costs across different service tiers, only to copy those numbers into an expense sheet later for approval.

With this MCP, your agent handles the entire sequence conversationally. Instead of jumping between screens, you simply ask: 'How much is it from X to Y?' Your agent runs `get_price_estimate` and provides a clear answer that integrates directly into your workflow.

Streamlining Cabify Ride Bookings via AI Agents

Manual booking requires multiple steps: first, confirming if the location is saved; second, checking current traffic for a time estimate; and

Now, your agent coordinates it all. You tell it to book the ride, and it automatically references saved locations (`get_saved_locations`), checks

third, finally executing the request. This chain of actions is slow and interrupts focus.

the route duration (`get_time_estimate`), and books the trip in one seamless action.

Cabify MCP: 9 Tools for Corporate Mobility Management

Use these tools to manage saved locations, check price estimates, track trip history, request bookings, and much more.

#	TOOL	DESCRIPTION
01	<code>add_saved_location</code>	Saves a new office address or frequent destination so you don't have to type out the full location details every time.
02	<code>cancel_ride</code>	Cancels an existing ride request when plans change, helping manage associated fees according to Cabify policy.
03	<code>get_available_products</code>	Checks which service types are available at a specific location so you know what options exist before booking.
04	<code>get_price_estimate</code>	Calculates the cost of a ride between two locations, allowing you to compare different Cabify service tiers upfront.
05	<code>get_ride_details</code>	Retrieves live information about an active trip or gives you full details on a past journey.
06	<code>get_ride_history</code>	Pulls all previous ride records, providing dates, costs, and business expense categories for accounting purposes.
07	<code>get_saved_locations</code>	Displays a list of all saved locations connected to the account, useful for quickly referencing common business addresses.
08	<code>get_time_estimate</code>	Provides an estimated travel time between points, adjusting the duration based on current traffic conditions.
09	<code>request_ride</code>	Books a new ride after confirming the price and availability by providing origin, destination, and optional product details.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U What were my total corporate travel costs last month?

Cabify Business Expense Summary

DATE RANGE	TOTAL RIDES	SERVICE TIER BREAKDOWN	TOTAL COST
Last 30 Days	14	Executive: 8, Lite: 6	€985.50

Data pulled from `get_ride_history`. You'll find the detailed breakdown attached to your expense folder.

U Can I get a price estimate and time estimate for my client meeting next week?

Route Analysis: Airport to Gran Vía

- **Best Service Tier:** Cabify Executive (Recommended)
- **Estimated Cost Range:** €35 - €42
- **Current Traffic Estimate:** 35 minutes

I've also added 'Gran Vía Office' to your saved locations for next time.

U Book a ride from the hotel, but cancel it if I need to change my mind.

Action Plan:

1. **Booking Initiated:** A Cabify Executive ride has been reserved for 7:30 AM tomorrow.
2. **Confirmation ID:** C-987654.
3. **Cancellation:** You can ask your agent to run `cancel_ride` anytime before the pickup window, and it will confirm the policy implications.

Frequently Asked Questions

01 How do I use Cabify MCP for AI Agents to track company expenses?

Your agent pulls a complete record of all past rides directly from your corporate account. It provides detailed reports including the date, specific service tier used, and cost, making expense filing straightforward.

02 Can Cabify MCP help me book a ride using saved addresses?

Yes, you can save all your frequent client or office locations. When booking a trip, the agent automatically uses these saved spots so you never have to type out long addresses again.

03 What if I need to know which ride service is best for my budget?

The MCP lets your agent compare prices instantly across all Cabify tiers. You can get a price estimate and choose the best balance between cost and service quality before booking anything.

04 Does using Cabify MCP help me plan routes around traffic?

Absolutely. The system runs real-time data to give you an estimated trip duration, which accounts for current traffic conditions so you can schedule your day accurately.

05 Is Cabify MCP good for companies with many employees?

It is built for corporate use. It centralizes booking, expense tracking, and ride management into one workflow, saving travel managers significant time across multiple locations.
