Coder Legion Developers MCP

Search and pull engineer profiles directly into your AI client.

Coder Legion Developers MCP gives your AI agent direct read access to the Coder Legion public directory. You can search for engineers by skill, location, or experience, browse the full roster, and pull detailed individual profiles. It works with any MCP-compatible client like Claude, Cursor, or Windsurf, and requires no account or API key to start pulling data.

A+ Quality Score 96.67/100

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Coder Legion Developers MCP

3 tools available

Cloud-hosted on Vinkius

You can now give your AI agent a window into the Coder Legion community. This MCP lets your agent navigate the public directory of engineers, pulling specific data points like skill tags, location, experience levels, and community stats. Instead of manually clicking through web pages, you can simply ask your agent to find specific talent or survey the landscape of available developers.

If you need to find a specialist, your agent can filter the community by combining name, skill, location, and minimum years of experience. Once you find a candidate that looks right, your agent can pull their entire public profile, including their headline, website, community roles, and detailed about text. It is a fast way to map out technical talent or find collaborators without the friction of manual searching. Since the directory is public, you don't need to manage any credentials or API keys; you just connect the MCP and start asking questions.

Core Capabilities

01 — Filtered Talent Discovery

Your agent uses search filters to find engineers by specific technical skills or locations.

02 — Directory Browsing

Your agent can paginate through the entire community roster to survey available talent.

03 — Deep Profile Inspection

Your agent pulls full biographical and statistical data for individual developers.

04 — Zero-Config Access

Your agent accesses public data without needing you to provide an API key or account.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/en/ai-agent-connect/coder-legion-developers — connect your AI agent in three steps.

- 01 Connect the MCP to your preferred AI client via Vinkius.
- 02 Ask your agent to search or list developers using natural language.
- 03 The agent calls the appropriate tool to query the public directory.
- 04 The agent receives structured profile data and presents it to you.

Connecting to the Coder Legion directory is a direct process that requires no manual setup.

Built For

This MCP is built for professionals who need to identify and vet technical talent within the Coder Legion community.

Recruiters

Use your agent to screen the community for specific skill sets and experience levels before reaching out.

Founders

Task your agent with mapping the talent landscape to find potential early hires or collaborators.

Developers

Ask your agent to find peers or mentors in specific regions or technical niches.

What Changes When You Connect

- 01 Eliminates manual searching by letting your agent handle directory navigation.
- 02 Removes the need to manage API keys or developer accounts.

-
- | | |
|-----------|---|
| 03 | Provides structured data that your agent can immediately process and summarize. |
| <hr/> | |
| 04 | Allows for complex multi-filter searches through natural language. |
-

Real-World Applications

Technical Sourcing

Ask your agent to find all developers in a specific city with at least 3 years of Python experience.

Competitor/Peer Mapping

Use the directory to identify the most active community members in a specific technology niche.

Vetting Collaborators

Have your agent pull full profiles to check a developer's community standing and verified status.

Talent Auditing

Survey the entire directory to understand the distribution of skills across the community.

Patterns to Avoid

Broad, unguided directory scraping

❌ AVOID

You ask your agent to list every single developer in the entire community at once to build a massive database.

✓ INSTEAD

Use `list\_developers` to walk through the directory in manageable pages of 18 profiles instead of requesting everything at once.

Vague talent searches

❌ AVOID

You tell your agent to find 'good developers' without providing any specific technical requirements or locations.

✓ INSTEAD

Be specific with your criteria. Use `search\_developers` to combine name, skill, location, and years of experience for precise results.

Surface level profile checks

⚠ AVOID

You rely only on the summary list to decide if a candidate is worth contacting.

✓ INSTEAD

Once you find a candidate of interest, use ``get_developer_profile`` to pull their full biography, verified status, and community roles.

The Right Fit

Connect this MCP if you need to identify, vet, or map technical talent within the Coder Legion community. Do not connect it if you are looking for private contact information or non-public user data. The decision depends on whether you need to turn the public directory into actionable intelligence for recruiting or collaboration.

Coder Legion Developers 3 Tools

These tools give your agent direct access to the Coder Legion directory, allowing for filtered searches, directory paging, and deep profile lookups.

#	TOOL	DESCRIPTION
01	get_developer_profile	This tool pulls a single developer's complete public profile using their handle. It returns everything from their verified status and community roles to their specific skills and about text.
02	list_developers	This tool lets your agent walk through the public directory in pages of 18 profiles. It provides names, headlines, locations, and experience levels for everyone in the roster.
03	search_developers	This tool searches the community using up to four filters like name, skill, location, or minimum years of experience. All filters combine with an AND logic to narrow down results.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

- U** Find Coder Legion developers with at least 5 years of experience who list prompt engineering as a skill.

I found several developers matching those criteria. The results include their names, verified status, and locations. Would you like me to pull the full profile for any of them?

- U** Show me the next page of the Coder Legion developer directory.

Here are the next 18 profiles from the directory, including their headlines and skill tags. I can keep paging through or help you filter this list.

- U** Open the Coder Legion profile of the first developer found in a search for Kubernetes skills and summarize their stats.

I've pulled that profile. The developer is verified, holds specific community roles, and has a significant number of followers. Their headline and about text are also available for review.

Frequently Asked Questions

01 Do I need an API key to use this MCP?

No. The Coder Legion directory is public, so this MCP works without any credentials or API keys.

02 How many profiles can the agent see at once?

The list tool returns profiles in batches of 18 using offset pagination.

03 Can I filter by multiple criteria?

Yes. You can combine name, skill, location, and minimum years of experience. These filters work together using AND logic.

04 What kind of data can my agent retrieve from a profile?

Your agent can get a developer's headline, location, website, community roles, stats like followers and points, and their full about text.

05 Which AI clients can I use with this?

You can use this with any MCP-compatible client, including Claude, Cursor, Windsurf, and VS Code.

06 Do I need an account or API key?

No. The Coder Legion developer directory and developer profile pages are public, so this connection is keyless — subscribe and use it. The separate Coder Legion connection covers the authenticated API surface (posts, jobs, series, groups, tags), which is where an API key is needed.

07 What data does a directory record include?

Each record has the developer's name, verified badge status, headline, location, years of experience, skill tags and the URL of their public profile. The profile tool adds community roles (with descriptions), website, join date, stats (points, badges, connections, followers, following), the full skill list and the about text.

08 How does search work, and what if a search returns nothing?

Filters combine with AND: name (partial match), a skill tag, a location, and a minimum years of experience (the directory supports 1, 3, 5 or 10). Results are paged by offset in groups of 18. When a combination comes back empty, drop the narrowest filter (usually the skill or the location) and retry — the tool tells the agent exactly that.

09 What happens if I pass a handle that does not exist?

The tool returns a clear "profile not found" error that points back at the directory tools, so the agent recovers by listing or searching first and then opening one of the returned profile URLs. Transient page-load failures surface as a retryable error instead of a crash.

Go Live in 60 Seconds

Get your connection token from cloud.vinkius.com, then paste the endpoint URL into any MCP-compatible client.

YOUR MCP ENDPOINT

`https://edge.vinkius.com/[TOKEN]/mcp`
