MCP SERVER | NO CODE | CLOUD HOSTED

Community Resource Referral Plan MCP

Turn complex social needs into organized, actionable support plans.

Community Resource Referral Plan MCP acts as a decision engine for social support. It takes raw user needs and eligibility constraints to build complete referral roadmaps, including communication scripts and follow-up schedules. Your AI client uses this to move from identifying a problem to executing a structured plan of action.

A+ Quality Score 95.83/100

referral | eligibility | scheduling | communication | community-resources

SCAN TO VIEW

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

> *The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.*
>
> — Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256	Ed25519	24h TTL	V8 Isolate
Encryption at rest	PKI vault signatures	Ephemeral session keys	Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

06 — Honeytoken Trap System

Phantom credentials are injected into isolated environments. If a honeytoken is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Community Resource Referral Plan MCP

4 tools available
Cloud-hosted on Vinkius

You can use this MCP to bridge the gap between identifying a person's needs and actually getting them connected to help. Instead of manually searching for resources and drafting emails, you give your AI client the user's specific constraints, such as location, transportation access, or household size. The MCP then processes these details to find the right matches and builds a step-by-step plan. It handles the heavy lifting of organizing the timeline, drafting the necessary documentation, and setting up a schedule to make sure no one falls through the cracks. It is designed to turn messy, non-clinical requests into a clean, professional sequence of events that you can act on immediately.

Core Capabilities

01 — Eligibility Filtering

Your agent uses this to match users with resources based on specific constraints like location or household size.

02 — Action Sequencing

The AI builds a chronological roadmap so you know exactly which resource to contact first.

03 — Document Preparation

Your client generates the specific scripts and templates needed to talk to service providers.

04 — Outcome Tracking

The MCP creates a schedule of follow-up tasks to ensure the referral is successful.

One Click on Vinkius — From Prompt to Execution

Available at **vinkius.com/en/ai-agent-connect/community-resource-referral-plan** — connect your AI agent in three steps.

01 Connect your MCP-compatible client to the Vinkius hosted environment.

02 Provide your agent with the user's specific needs and constraints.

03 The MCP identifies eligible resources and builds a prioritized sequence.

04 Your agent generates the necessary communication scripts and follow-up schedules.

Connect your client to Vinkius and start turning needs into plans.

Built For

Social workers and community advocates use this to manage the logistics of client support.

Case Managers

They hand off client constraint data to the AI to generate structured support roadmaps.

Community Advocates

They use the tool to quickly find and organize local resources for individuals in need.

Social Service Coordinators

They rely on the follow-up scheduling to track the progress of multiple referrals.

What Changes When You Connect

01 Converts raw user needs into structured, prioritized action plans.

02 Reduces manual drafting by generating communication templates.

03 Prevents missed connections through automated follow-up scheduling.

04 Matches resources based on real-world constraints like transit access.

Real-World Applications

Emergency Food Assistance

Match a family with no transportation to local food pantries that are reachable by bus.

Housing Referral Management

Build a step-by-step timeline to guide a client through a housing application process.

Utility Support Coordination

Generate the exact list of documents a client needs to present to a utility assistance program.

Resource Gap Analysis

Use eligibility filtering to see which available community resources actually fit a specific user profile.

Patterns to Avoid

Manual resource searching

AVOID

You spend hours scrolling through PDF directories and websites to find a food pantry that accepts specific vouchers.

✓ INSTEAD

Give your client the user's constraints and use identify_eligible_resources to find matches instantly.

Vague referral requests

AVOID

You tell your agent to find 'help for a family' without mentioning they lack a car or have three children.

✓ INSTEAD

Provide specific details like transit access or household size so identify_eligible_resources can filter for real-world feasibility.

Disorganized follow-up steps

AVOID

You send a referral and then hope the client actually makes it to the appointment.

✓ INSTEAD

Use create_followup_schedule to build a timeline of touchpoints that ensures the process reaches completion.

The Right Fit

Connect this MCP if you manage high volumes of client referrals and need to turn messy intake notes into structured plans. Do not connect it if you only handle a few, highly predictable cases where manual entry is faster than typing constraints into an AI client.

Community Resource Referral Plan Tools

These tools turn raw client constraints into organized, actionable support plans. They handle the heavy lifting of filtering, sequencing, and documentation.

#	TOOL	DESCRIPTION
01	`create_followup_schedule`	This tool builds a timeline of touchpoints to ensure the referral process actually reaches completion.
02	`generate_referral_sequence`	This tool organizes selected resources into a prioritized, chronological plan of action.
03	`identify_eligible_resources`	This tool filters your approved resource list to find matches that meet a user's specific eligibility and constraints.
04	`prepare_communication_package`	This tool creates the specific verbal templates and documentation needed to execute a referral.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U I need food assistance for a family of four in Chicago. They have no car and need help immediately.

I found two food pantries in Chicago that are accessible by transit and meet your household size requirements. I will now build a prioritized referral sequence and contact scripts for you.

U Create a follow-up plan for a housing referral with weekly check-ins.

The follow-up calendar is ready with weekly check-ins starting from your referral deadline to track the housing application progress.

U What documents do I need for the utility assistance program?

The communication package includes a list of required documents, such as proof of residency and recent utility bills, to show the provider.

Frequently Asked Questions

01 **What kind of clients can I use this MCP with?**

You can use this with any MCP-compatible client, including Claude, Cursor, Windsurf, and VS Code.

02 **Do I need to host the MCP myself?**

No, Vinkius hosts and manages the MCP for you, so it is ready to use as soon as you connect.

03 **How does the tool handle specific user constraints?**

The identify_eligible_resources tool processes specific profiles, such as location or household size, to filter the resource list.

04 **Can this help with follow-up tasks?**

Yes, the create_followup_schedule tool generates a timeline of touchpoints to ensure the referral process is completed.

05 **Does it provide scripts for talking to providers?**

Yes, the prepare_communication_package tool creates verbal templates and documentation for executing referrals.

06 **How does the server determine which resources are suitable?**

The `identify_eligible_resources` tool matches user constraints like income, residency, and transport availability against the provided resource list.

07 **Can I generate scripts in different languages?**

Yes, the `prepare_communication_package` tool generates contact scripts in the user's preferred language.

08 **How are the referral steps prioritized?**

The `generate_referral_sequence` tool organizes steps based on user-provided `contactOrderRules`, such as prioritizing emergency needs over long-term stability.

Go Live in 60 Seconds

Get your connection token from **cloud.vinkius.com**, then paste the endpoint URL into any MCP-compatible client.

YOUR MCP ENDPOINT

```
