

MCP SERVER

NO CODE

CLOUD HOSTED

Creative Collaborator Credit Plan MCP

Handle complex contributor attribution and credit workflows without the manual headache.

Creative Collaborator Credit Plan MCP manages how contributors get credited for their work. It reconciles inputs, prior agreements, and consent to build accurate credit proposals. Your AI client uses this to draft layouts, manage approval steps, and lock in final attribution records while handling disputes or media-specific formatting needs.

management

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Creative Collaborator Credit Plan MCP

5 tools available

Cloud-hosted on Vinkius

Managing who gets credit for what in a creative project is often a mess of emails and conflicting verbal agreements. This MCP gives your AI client a structured way to handle those details. You can use it to reconcile what people said they would get with what they actually contributed. It builds a bridge between initial project discussions and the final, locked-in attribution record.

When you're working on large-scale productions, you can use it to draft credit layouts, set up approval workflows to get everyone's sign-off, and then finalize the records once everyone is happy. If a contributor disagrees with their assigned role, the MCP provides a roadmap to resolve that conflict based on existing agreements. It also helps you adapt those credits for different outlets, whether you're publishing a digital piece or a physical print, so you don't have to manually reformat every single credit line.

Core Capabilities

01 — Credit Drafting

Your agent creates initial layouts of contributor credits.

02 — Workflow Management

Your agent sets up the approval steps needed to finalize credits.

03 — Conflict Mediation

Your agent follows a roadmap to resolve disputes over roles or credits.

04 — Format Adaptation

Your agent identifies formatting changes for different media outlets.

05 — Record Locking

Your agent creates formal, final records of all attribution decisions.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/en/ai-agent-connect/creative-collaborator-credit-plan — connect your AI agent in three steps.

- 01
- Connect your MCP-compatible client to Vinkius.
-
- 02
- Provide contributor details and prior agreements to your agent.
-
- 03
- Use the MCP to generate a credit proposal and approval workflow.
-
- 04
- Resolve any disagreements using the provided mediation roadmap.
-
- 05
- Finalize the attribution record to lock in the credits.
-

Connect your client to Vinkius and start managing credits through your AI interface.

Built For

This MCP is built for creative professionals who need to manage contributor rights and credits systematically.

Creative Producers

They hand off contributor lists and agreement details to the AI to generate formal credit workflows.

Project Managers

They use the AI to manage the approval process and resolve disputes between team members.

Editorial Leads

They use the AI to ensure credits are correctly formatted for various publishing outlets.

What Changes When You Connect

- 01
- Reduces manual errors in contributor attribution.
-
- 02
- Provides a clear path for resolving credit disputes.
-

-
- 03** Standardizes the approval process from proposal to final record.
-
- 04** Adapts credit formatting for different media types automatically.
-

Real-World Applications

Film and Video Production

Manage the complex list of crew credits and ensure everyone's role is accurately recorded.

Digital Publishing

Handle contributor credits and adapt them for web, social media, or print formats.

Dispute Resolution

Use a structured roadmap to settle arguments about how a contributor should be credited.

Contract Compliance

Reconcile actual project contributions with prior agreements to ensure accurate credit proposals.

Patterns to Avoid

Manual credit reformatting

❌ AVOID

You spend hours manually typing out credit lines for a print version after finishing a digital release.

✓ INSTEAD

Let your agent identify the necessary changes using `get_outlet_specific_actions` to handle different media formats.

Ignoring verbal agreements

❌ AVOID

You rely on memory or scattered emails to decide who gets credit for a specific role.

✓ INSTEAD

Use `generate_credit_proposal` to draft layouts based on actual project data and prior agreements.

Unstructured dispute handling

❌ AVOID

A contributor argues about their role and you try to settle it through a messy, unorganized email thread.

✓ INSTEAD

Follow a structured roadmap by using `get_disagreement_resolution_agenda` to mediate the conflict.

The Right Fit

Connect this MCP if your production workflow involves multiple contributors with varying rights and complex attribution needs. Do not connect it if you work on solo projects where credits are trivial. The deciding factor is whether you need a formal, repeatable process to move from a credit proposal to a locked record.

Creative Collaborator Credit Plan Tools

These tools handle everything from initial credit drafts to final, locked attribution records. They bridge the gap between verbal agreements and formal project documentation.

#	TOOL	DESCRIPTION
01	finalize_attribution_record	Use this to lock in the credit structure and generate a formal, permanent record of the attribution.
02	generate_credit_proposal	This tool drafts a layout showing how contributors should be credited based on project data.
03	get_disagreement_resolution_agenda	This tool provides a structured roadmap to help mediate and resolve conflicts regarding credits.
04	get_outlet_specific_actions	Use this to identify the technical or formatting changes required for different media formats.
05	create_confirmation_workflow	This tool builds the specific steps needed to move a credit proposal through to a final, approved attribution.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

- U** Generate a credit proposal for a project with three contributors: Alice (Lead Designer), Bob (Illustrator), and Charlie (Technical Architect), following alphabetical order.

The proposed credit list is: Alice (Lead Designer), Bob (Illustrator), and Charlie (Technical Architect).

- U** What are the steps to finalize the attribution for a digital publication?

The workflow includes verifying individual consent and performing a final proofreading for digital formats.

- U** How can I resolve a dispute regarding the role description of a contributor?

You should use the disagreement resolution agenda to mediate the role-description-dispute by reviewing prior agreements.

Frequently Asked Questions

01 What does this MCP actually do?

It manages the entire workflow for contributor attribution, from drafting initial credit proposals to resolving disputes and finalizing formal records.

02 Can I use this with Claude or Cursor?

Yes, you can connect this MCP to any MCP-compatible client like Claude, Cursor, or Windsurf through Vinkius.

03 How does it help with credit disputes?

The MCP includes a tool that provides a structured roadmap to mediate conflicts by reviewing prior agreements.

04 Does it handle different media formats?

Yes, it can identify the specific technical or formatting changes needed to adapt credits for different outlets.

05 Is the credit information permanent?

Once you use the tool to finalize the attribution record, it creates a formal and locked-in record of the credit structure.

06 How does the tool handle conflicting credit requests?

You can use ``get_disagreement_resolution_agenda`` to generate a structured mediation roadmap that references existing ``priorAgreements`` and current ``consentStatus`` to resolve disputes.

07 Can I change the credit list after it is finalized?

No. Once ``finalize_attribution_record`` is executed, the record is immutable. Any changes require generating a new proposal and a new record.

08 How do I prepare credits for a specific publication like a book or a website?

Use ``get_outlet_specific_actions`` with your finalized record ID to receive technical instructions and formatting requirements for your target outlet.

Go Live in 60 Seconds

Get your connection token from cloud.vinkius.com, then paste the endpoint URL into any MCP-compatible client.

YOUR MCP ENDPOINT
