MCP SERVER | NO CODE | CLOUD HOSTED

Eventzilla MCP

Manage Event Logistics via Natural Conversation

Eventzilla connects your AI agent to a full event management suite for real-time operations. List all events, track attendees, check people in using barcodes, and audit ticket sales or transaction history—all without opening any dashboards.

A+ Quality Score 100/100

event-registration | check-in | attendee-tracking | ticketing | event-logistics

SCAN TO VIEW

The infrastructure that powers AI agents in the real world.

Vinkius connects AI to the world's software through secure, enterprise-grade infrastructure — enabling real-world execution at scale, built on the Model Context Protocol (MCP).

Your AI Connections Run Through Vinkius Cloud

The world's largest managed MCP catalog

Vinkius is the cloud infrastructure where AI agents connect to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

> *The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.*
>
> — Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256	Ed25519	24h TTL	V8 Isolate
Encryption at rest	PKI vault signatures	Ephemeral session keys	Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

MCP ENDPOINT

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

06 — Honeytoken Trap System

Phantom credentials are injected into isolated environments. If a honeytoken is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1) Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Eventzilla MCP

11 tools available
Cloud-hosted on Vinkius

Connecting this MCP turns complex event logistics into simple conversations. You tell your agent what you need done, and it handles the backend work, whether you're running a small workshop or a huge conference. It lets you list all active events to find exactly what you’re tracking. Need to know who showed up? Your agent can fetch complete attendee profiles and monitor real-time check-in status using barcodes. You can also audit ticket sales by querying transaction history for specific amounts, or analyze your audience by listing custom registration questions. Because this MCP is hosted on Vinkius, you connect once from your AI client and get access to the entire event ecosystem. This keeps all your data—from attendance records to financial orders—in one place.

Core Capabilities

01 — Manage Event Information

Retrieve details for any event in your account, or list out all active events available.

02 — View Attendee Records

Get full profiles of registered attendees and fetch a comprehensive list of participants for an event.

03 — Process Check-Ins

Perform digital check-ins using barcodes to verify attendance and manage entry flow directly from your chat interface.

04 — Audit Financial Data

List all transactions, monitor ticket types, and query specific financial orders for any event.

05 — Analyze Registration Details

Retrieve custom questions asked during registration or list available discount codes to analyze audience behavior.

One Click on Vinkius — From Prompt to Execution

Available at **vinkius.com/mcp/eventzilla-alternative** — connect your AI agent in three steps.

01 Subscribe to this MCP and provide your Eventzilla API Key.

02 Tell your AI client the task: 'List all upcoming events' or 'Check in attendee X'.

03 Your agent executes the necessary calls, retrieving real-time data (e.g., transaction records, check-in status) directly into the chat window.

The bottom line is you talk to your AI client like talking to a human staff member who has access to all the event's systems.

Built For

This MCP is for anyone running structured events—conferences, training sessions, or workshops. If you spend time juggling multiple dashboards just to track attendance or revenue, this saves your sanity.

Event Operations Manager

Using the agent to list all events and perform rapid check-ins for large groups of attendees on site.

Marketing Coordinator

Analyzing attendee demographics by listing registration questions or monitoring active discount codes before a campaign launch.

Financial Controller

Running simple queries to list transactions and audit financial orders for revenue reporting after the event concludes.

What Changes When You Connect

01 You instantly know who's showing up. Instead of manually checking spreadsheets, you can use the `list_attendees` tool to get a real-time count and status for any event.

02 Stop logging into separate dashboards for money tracking. Use `list_transactions` or `get_transaction` to immediately audit revenue and check sales history through your chat interface.

03 On site, speed matters. Your agent handles digital check-ins using barcodes instantly via the `checkin_attendee` tool, keeping the line moving without manual data entry.

04 Deep dive into audience behavior. You can list registration questions (`list_questions`) and monitor discount codes to understand what attendees care about before you even plan your next event.

05 Never lose an attendee profile again. Use `get_attendee` to pull up every detail—from their name to their specific answers on a registration form—in one place.

Real-World Applications

Mid-Conference Check-In Crisis

The main entrance line is backed up, and staff are manually scanning tickets. Instead of having multiple people running to different stations, the operations manager asks their agent to perform a mass check-in using `list_attendees` followed by bulk `checkin_attendee` calls. The status updates immediately in the chat window.

Post-Event Revenue Reconciliation

The financial controller needs to know if the 'Premium Ticket' sales match the budget for next month. They ask their agent to use `list_transactions` and then narrow it down with `get_transaction`, instantly verifying revenue sources without running a complicated report.

Marketing Campaign Audit

The marketing team needs to know why ticket sales dipped last week. They ask the agent to list both available discount codes (`list_discount_codes`) and check specific attendee profiles using `get_attendee` to see which groups used which offers.

Quick Event Overview

A stakeholder asks for a status update on 'Global Tech Summit'. Instead of asking staff to pull reports, the agent uses `list_events` and then immediately calls `get_event` to provide all key metrics—like total attendees and revenue summary —in one conversation.

Patterns to Avoid

Treating it like a spreadsheet tool

✗ AVOID

Trying to feed the agent 50 attendee names and saying 'check them all in.' The AI will struggle with bulk inputs or require too many separate steps.

✓ INSTEAD

Use `list_attendees` first to confirm the event ID. Then, process check-ins by batches or by asking the agent to focus on a specific subset of attendees.

Confusing transactions with listings

✗ AVOID

Asking 'show me all sales' but not specifying an event or date range. The tool might return too much data, confusing the user.

✓ INSTEAD

Always specify which event you are interested in first. Then use `list_transactions` to narrow down the scope.

Ignoring core event metadata

✗ AVOID

Only asking about attendees without checking if the ticket type is correct, leading to confusion over access rights.

✓ INSTEAD

Start by using `get_event` or `list_tickets`. This confirms the boundaries and rules for the specific event you are managing before performing actions.

The Right Fit

Use this MCP if your pain point is coordinating information across different event systems—specifically, when attendance tracking, ticketing sales, and attendee data live in separate places. You need an agent that can cross-reference who was registered (using `get_attendee`), what they paid for (`list_transactions`), and whether they physically showed up (`checkin_attendee`). Don't use this if you just need a simple calendar reminder or basic mailing list management; those are better handled by dedicated CRM tools. Also, don't rely on it to create new events; it only manages existing event data.

The manual process of running an event is always worse than the planning.

Right now, every time a conference happens, staff are clicking through dozens of tabs. They check one system for registration counts, another to see who paid, and yet a third dashboard to manually track physical attendance using printed lists or separate scanner logins. The data is always fragmented, requiring someone to copy names from a spreadsheet into the check-in terminal.

With this MCP, you bypass those dashboards entirely. Your agent takes your natural language request—'Show me all attendees who paid for premium tickets and check them in.'—and handles the multi-step process instantly. You get immediate, consolidated operational data without ever touching a complicated user interface.

Getting Full Visibility with Eventzilla MCP

The biggest time sinks disappear: no more manually fetching attendee lists from one page and then logging into another system just to check ticket validity. You can use `list_attendees` and simultaneously query their transaction history using `get_transaction` in a single command.

This gives you total control over the event lifecycle, from initial marketing (monitoring discount codes) through day-of operations (check-ins), and finally to post-event finance (auditing revenue). You run the entire show conversationally.

Eventzilla Alternative: 11 Tools for Event Management

Use these tools to query event metadata, manage attendee profiles, perform real-time check-ins, and audit all financial transactions associated with your events.

#	TOOL	DESCRIPTION
01	`checkin_attendee`	Marks a specific attendee as checked in using their details.
02	`get_attendee`	Retrieves detailed information for a single registered participant.
03	`get_event`	Fetches all specific metadata and details about one particular event.
04	`get_transaction`	Retrieves the full details of a single financial transaction or order.
05	`list_attendees`	Lists all registered attendees for a specified event, giving you an overview count.
06	`list_categories`	Retrieves the available general categories used to classify events (e.g., Business or Music).
07	`list_discount_codes`	Shows all active discount codes that can be applied during registration.
08	`list_events`	Provides a comprehensive list of every event the account is tracking.
09	`list_questions`	Lists the specific questions used in the registration process to gather audience data.
10	`list_tickets`	Provides a list of all ticket types available for purchase at an event.
11	`list_transactions`	Lists multiple financial transactions that occurred for a specific event.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U List all live events in my account.

I've retrieved your live events. You currently have 3 active events: 'Global Tech Summit 2024', 'AI Workshop Series', and 'Networking Night'. Which one would you like to drill into?

U Fetch the attendee list for event ID 987654.

I've retrieved the attendee list for that event. There are 120 registered participants. Notable names include 'Mark Thompson' and 'Sarah Jenkins'. Would you like the check-in status for any of them?

U Show the transaction history for event 'Global Tech Summit'.

Fetching transaction records... For the 'Global Tech Summit', I found 85 successful orders totaling $12,500 in revenue. I can list the specific reference numbers and amounts if needed.

Frequently Asked Questions

01 **How do I list all upcoming events using Eventzilla MCP?**

You use the `list_events` tool. This gives you a comprehensive roster of every event ID and name in your account, which is the starting point for any other task.

02 **Can I track who paid what using Eventzilla MCP?**

Yes. You can use `list_transactions` to view multiple sales records for a specific event, and then use `get_transaction` if you need the full details on one single order.

03 **Does Eventzilla MCP handle check-ins in bulk?**

Yes. After listing attendees with `list_attendees`, you can tell your agent to process them, and it uses the `checkin_attendee` tool to mark multiple people as present.

04 **How do I check attendee details with Eventzilla MCP?**

You use `get_attendee` by providing a unique identifier. This retrieves all stored information, including their registration answers and current status.
