

MCP SERVER

NO CODE

CLOUD HOSTED

Fellow MCP

Manage every meeting note, task, and recording.

Fellow MCP lets your AI agent take full control of all things meeting-related. You can list every note and recording, track action items across multiple projects, get detailed transcripts, and even mark tasks as complete—all from a single chat window. Stop juggling documents; manage your entire knowledge base with Fellow.

A+ Quality Score 100/100

The infrastructure that powers AI agents in the real world.

Vinkius connects AI to the world's software through secure, enterprise-grade infrastructure — enabling real-world execution at scale, built on the Model Context Protocol (MCP).

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the cloud infrastructure where AI agents connect to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Fellow MCP

12 tools available
Cloud-hosted on Vinkius

Tired of having to jump between notes, recordings, and task lists just to figure out who owns what? This MCP connects your agent directly to your Fellow account, giving you total command over meeting documentation. You can ask your AI client to list all meeting notes, instantly pulling out the agenda items or key decisions made weeks ago. Need to know if someone actually finished their part of the plan? Just run a query to see and filter every action item across all meetings. The agent handles the heavy lifting—it pulls transcripts with speaker names and timestamps for review, finds recording links, and even marks tasks as done when you give the word. This makes meeting management feel less like administration and more like actual conversation. Connecting your tools via Vinkius means you only connect once to your preferred AI client (like Claude or Cursor) and gain access to this entire catalog of capabilities.

Core Capabilities

01 — Review Meeting Documentation

List all notes, retrieve the full content for a specific meeting, or even permanently delete old records.

02 — Audit Action Items

See and filter every task assigned across all meetings, check who owns it, and mark items as completed or archived.

03 — Manage Recordings and Transcripts

Browse recordings to get details, download transcripts with timestamps, or delete video files.

04 — Verify User Identity

Confirm which user account is connected to the system by retrieving your profile name and email address.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/fellow — connect your AI agent in three steps.

- 01** Subscribe to this MCP and provide your Fellow API Key (you find this key in User Settings > Account > API Tokens).
- 02** Connect the MCP to your preferred AI client, like Cursor or Claude.
- 03** Start asking natural language questions—ask it to list all pending tasks or pull notes from a specific meeting date.

The bottom line is that you manage your entire work history—notes, recordings, and action items—using simple conversation prompts.

Built For

This MCP is for anyone whose job involves too much meeting follow-up. It helps managers who hate manual status reports, product leads who need to audit past decisions, or executive assistants who spend hours organizing documentation.

Project Manager

Uses the MCP to check cross-meeting task statuses and pull all related notes into one place, eliminating manual follow-up.

Product Owner

Searches across multiple meeting transcripts using natural language to audit past decisions or find specific requirements that were discussed months ago.

Executive Assistant

Retrieves and organizes meeting recordings, providing clean links and full transcripts for stakeholders who need documentation quickly.

What Changes When You Connect

- 01** Stop losing information in old documents. You can use `list_notes` to pull up all meeting documentation quickly, letting you review structured content like agendas and decisions instantly.

-
- 02 Never miss a follow-up again. By listing all action items across meetings, you get one single view of every task, who it's assigned to, and when it's due.

 - 03 No more separate documents for video files. You can `list_recordings` and then use `get_transcript` to pull out the exact discussion points from a recording, even with speaker names attached.

 - 04 Maintain clean records by using `delete_note` or `delete_recording`. When you need to strictly manage your organization's data, this MCP gives you irreversible control over specific files.

 - 05 Keep track of task lifecycle flawlessly. Use `complete_action_item` when work is done, or `archive_action_item` if the task needs to be preserved but isn't currently active.
-

Real-World Applications

The Post-Mortem Review

A product manager needs to understand why a feature was delayed. They ask their agent for transcripts of the 'Q3 Planning' recording and then cross-reference those notes with all action items from that meeting, verifying who owned the delay decision.

Historical Research

A team lead has forgotten the exact decision on a compliance requirement from six months ago. They use `get_note` for the relevant meeting ID, then ask the agent to extract only the finalized decisions and key discussion points.

The Status Check

An executive assistant needs a consolidated list of tasks. Instead of checking three different project boards, they ask their agent to `list_action_items` and immediately see which items are pending across all departments.

Data Cleanup

An operations team needs to purge old, irrelevant project notes. They use `list_notes` to find all records older than a year, review them via `get_note`, and then permanently delete the outdated items using `delete_note`.

Patterns to Avoid

Treating it like a search engine

✗ AVOID

Asking the agent vague questions like 'Tell me about Q2 meetings' when they actually need specific data points. This leads to incomplete answers and requires multiple follow-ups.

✓ INSTEAD

Be precise. Use `list_notes` to identify the exact meeting ID or date range, then use `get_note` or `get_transcript` with that ID for a targeted answer.

Manually tracking tasks

✗ AVOID

Juggling emails and spreadsheets to track who finished their deliverables. This is error-prone and wastes time.

✓ INSTEAD

Use `list_action_items` to get the master roster of all open tasks, then use `complete_action_item` or `archive_action_item` to update status directly through your agent.

Ignoring recording context

✗ AVOID

Assuming a summary note is enough. Key details often live only in the raw audio or video.

✓ INSTEAD

Always use `get_transcript` when reviewing recordings, as this provides full speaker attribution and timestamps, giving you maximum detail.

The Right Fit

Use this MCP if your workflow is centered on managing complex, persistent meeting data: notes, recorded discussions, and assigned tasks. You need to connect the dots between what was said (transcripts), who wrote it down (notes), and who agreed to do something (action items). Don't use this if you just need a simple knowledge base—if your goal is purely reading Wikipedia-style articles, you don't need the full scope. Also, don't rely on it for real-time scheduling or calendar management; this MCP manages *outcomes*, not appointments. If you only care about task status and notes, but never recordings, then you might be able to use a more limited tool, but this MCP gives you everything.

The Manual Effort of Meeting Follow-Up

Think about the last big project review. You have five different documents: the main notes from Notion, a separate file with decisions, the recording link on Slack, and then a messy thread in email confirming action items. Your job is to manually copy dates, search for names, cross-reference who was supposed to do what, and then paste it all into one master summary.

With this MCP, you just ask your agent: 'Give me all the decisions made about Feature X from the last quarter.' The system pulls the notes using `list_notes`, extracts the decision metadata, finds the relevant transcript via `get_transcript`, and hands you a clean answer. You don't touch a single tab.

Fellow MCP: Command Your Meeting Data

The manual steps that disappear are searching for the 'final version' of notes, jumping between recordings to find one specific quote, and then having to manually update a spreadsheet every time an action item is marked done.

Now, you talk to your agent. You simply ask it to mark an action item complete using `complete_action_item`, and the status updates instantly across all integrated systems. It's real-time accountability.

Fellow MCP: 12 Tools for Meetings

These tools allow you to manage every aspect of your meeting workflow, from listing basic documentation to completing complex action items.

#	TOOL	DESCRIPTION
01	<code>list_notes</code>	Lists all available meeting notes within your Fellow workspace.
02	<code>get_note</code>	Retrieves the complete content and details for a single, specific meeting note by its ID.
03	<code>delete_note</code>	Permanently removes an entire meeting note record using its unique ID. Requires confirmation.
04	<code>list_recordings</code>	Lists all video and audio recordings captured by Fellow for easy browsing.
05	<code>get_recording</code>	Retrieves the specific details of a meeting recording, including access links.
06	<code>delete_recording</code>	Permanently deletes an entire meeting recording by its ID. Requires confirmation.
07	<code>get_transcript</code>	Pulls the full, detailed transcript of a selected meeting recording with speaker attributions and timestamps.
08	<code>list_action_items</code>	Retrieves a comprehensive list of every action item assigned across all your meetings for accountability tracking.
09	<code>get_action_item</code>	Looks up and shows the detailed status and assignment information for one specific task by ID.
10	<code>complete_action_item</code>	Marks an existing action item as finished, updating its status in your workspace.
11	<code>archive_action_item</code>	Removes a task from active views without deleting the underlying data, keeping records intact.
12	<code>get_current_user</code>	Checks and reports your authenticated Fellow user profile identity (name, email).

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Show me all my pending action items

Retrieving action items... I found 5 pending tasks. Highlights include 'Update Q2 Roadmap' (Due Tomorrow) and 'Send follow-up to Client A'. Would you like the ID for any of these to mark them as complete?

U Get the notes for the meeting 'Product Sync' from last Tuesday

Found it! The notes for 'Product Sync' (March 24) include 3 agenda items and 2 finalized decisions regarding the feature launch. I can display the full discussion points for you.

U List the last 3 meeting recordings

Retrieving recordings... Here are the 3 most recent: 'Strategic Planning' (1h 20m), 'Daily Standup' (15m), and 'Design Review' (45m). Which one would you like the transcript or recording URL for?

Frequently Asked Questions

01 How can I list notes using the Fellow MCP?

You use the `list_notes` tool as your starting point. This action browses all meeting documentation within your connected Fellow workspace, giving you an overview of everything recorded.

02 Can I find a specific discussion detail from a video recording with Fellow MCP?

Yes, use the `get_transcript` tool. It pulls the full transcript and includes speaker attribution and timestamps, so you can pinpoint exactly who said what and when.

03 What's the difference between `list_action_items` and getting a single item?

`list_action_items` gives you a comprehensive overview of every task across all meetings. `get_action_item` lets you drill down into one specific task to view its full details.

04 Does Fellow MCP allow me to delete old documents?

Yes, the MCP provides tools like `delete_note` and `delete_recording`. These functions permanently remove files by ID, giving you complete control over your organizational data hygiene.

05 What if I want to check who is connected to the system?

You use the `get_current_user` tool. This simply retrieves and verifies your authenticated Fellow user profile identity (name, email) for permission checks.
