

MCP SERVER

NO CODE

CLOUD HOSTED

ManoMano MCP

Control your pricing, orders, and inventory instantly.

ManoMano MCP lets you manage your entire seller account through natural conversation. Use this connector to update offer prices, track incoming orders, and audit fulfillment stock levels directly from your agent without logging into the marketplace dashboard.

A+ Quality Score 100/100

The infrastructure that powers AI agents in the real world.

Vinkius connects AI to the world's software through secure, enterprise-grade infrastructure — enabling real-world execution at scale, built on the Model Context Protocol (MCP).

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the cloud infrastructure where AI agents connect to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

ManoMano (Home Improvement Marketplace) MCP

11 tools available
Cloud-hosted on Vinkius

Managing a major marketplace like ManoMano means juggling inventory, pricing, and order flow across multiple tabs. This MCP puts full control of your seller account right where you work. You can ask your agent to list every published offer or retrieve detailed metadata for specific items, including current stock and VAT-included prices. Need to adjust pricing? Just tell your AI client to update the price for an entire product line. When orders come in, track them all using simple commands; confirm pending shipments with `accept_order` or mark fulfilled goods by supplying tracking numbers via `ship_order`. Plus, you can check stock levels maintained through ManoFulfillment. If you're looking for a central place to manage marketplace operations, connecting your account through Vinkius is the fastest way to get started.

Core Capabilities

01 — Adjusting Offer Details

The agent updates an offer's price or changes its available stock count with simple instructions.

03 — Auditing Inventory Status

The MCP lists all current published offers or checks stock levels held in the ManoFulfillment warehouse.

02 — Tracking and Processing Orders

You list all received orders, retrieve full customer details, and move order status from pending to shipped using tracking numbers.

04 — Catalog Discovery

You enumerate available root category listings and registered brands to help map new products into your catalog structure.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/manomano-home-improvement-marketplace — connect your AI agent in three steps.

- 01** First, subscribe to this MCP on Vinkius and provide your ManoMano API Key.
- 02** Then, invoke the connector via your AI client (like Claude or Cursor) with a request—for example, asking to 'list all received orders'.
- 03** The agent executes the necessary tool calls and returns structured data about your marketplace operations directly into your chat window.

The bottom line is you get full control of complex seller tasks using plain English commands instead of navigating multiple web dashboards.

Built For

This MCP is for e-commerce operations managers and marketplace sellers who spend too much time manually updating pricing, checking stock levels across different systems, or chasing down order fulfillment status. If you're tired of copying data from one seller portal into a spreadsheet to figure out what needs changing, this is for you.

E-commerce Operations Manager

You use the MCP to audit the entire order flow, retrieving complete customer details and ensuring that every pending shipment has been properly accepted or marked as shipped.

Inventory Specialist

On a daily basis, you check stock levels via ``list_fulfillment_stock`` and use ``update_offer_price`` to keep your listings competitive based on real-time inventory data.

Marketplace Seller

You manage the product catalog by using tools like ``list_categories`` and ``list_brands`` to ensure new items are correctly mapped before listing them for sale.

What Changes When You Connect

-
- 01 Stop manually tracking stock. Use `list_fulfillment_stock` to get real-time visibility into items stored in the ManoFulfillment warehouse without logging out of your workspace.

 - 02 Never miss a sale due to outdated prices. You can tell your agent to use `update_offer_price` and adjust entire product lines instantly, keeping you competitive on the marketplace.

 - 03 Handle order backlogs immediately. Instead of clicking through dashboards, simply ask your AI client to process pending orders using `accept_order` or confirm shipment details with `ship_order`.

 - 04 Simplify complex data retrieval. Use `get_order` to pull a full record containing everything from the customer's name to the delivery address in one clean call.

 - 05 Maintain catalog integrity effortlessly. You can use `list_categories` and `list_brands` to map new products correctly, eliminating manual taxonomy setup time.
-

Real-World Applications

The End-of-Day Audit

A manager needs to know which orders were received today and if they can be fulfilled. They ask their agent to run `list_orders` first, then check the delivery addresses using `get_order` for the top 5 most valuable pending items.

The Fulfillment Check

Logistics needs confirmation on stock. They prompt the agent with a request for fulfillment levels; the system runs `list_fulfillment_stock`, confirming that 150 units of SKU 'DRILL-01' are available.

The Price Correction

A competitor drops their pricing on a key item. The seller immediately asks the agent to run `list_offers`, identifies the target SKU, and then uses `update_offer_price` to beat the new low price instantly.

The Shipment Confirmation

An order is ready to go. Instead of manually updating a status field, the seller prompts the agent to `ship_order`, providing the carrier and tracking number so the record updates automatically.

Patterns to Avoid

Trying to process orders one by one

X AVOID

Copying Order #123 details into a spreadsheet, then manually checking ManoMano for Order #456 details, and doing this repeatably all day.

✓ INSTEAD

Ask your agent to run `list_orders` first. This gives you a consolidated list of everything needed. Then, use `get_order` if you need deep details on a specific order.

Forgetting the stock source

X AVOID

Thinking that all inventory is listed in one place and manually checking both your warehouse system and ManoMano's listing simultaneously.

✓ INSTEAD

To ensure accuracy, always run `list_fulfillment_stock` first. This checks the official count maintained by ManoFulfillment before you update anything.

Manually updating prices after a sale

X AVOID

Making an adjustment to your pricing and then having to manually tell the system what SKU you changed, risking typos or missed items.

✓ INSTEAD

Simply prompt the agent: 'Update the price for offer XYZ.' The agent handles identifying the correct tool (`update_offer_price`) based on context.

The Right Fit

Use this MCP if your daily job involves juggling multiple, interconnected data points across different seller portals,

specifically around pricing, inventory levels, and order status. If you need to change an offer's price *and* check the fulfillment stock in one conversation, this is perfect. Don't use it if you only need basic reporting; a simple database query tool will suffice for just reading data. However, if your goal is complex catalog mapping (e.g., 'find all related brands and categories'), look into dedicated taxonomy tools instead of relying solely on `list_categories` and `list_brands`.

The Messy Process of Managing Marketplace Listings Today

Think about how you start your day. You open the ManoMano dashboard, then you switch to your inventory sheet. You copy a price from one tab and paste it into another. Then you have to check which orders are pending, opening multiple windows just to see if you can accept them or if they need a tracking number added. It's a cycle of clicking, copying, and cross-referencing data across three different systems.

With this MCP, the process shrinks down to conversation. You simply tell your agent what needs fixing—for example, 'I need to increase the price for all drill bits by 10%.' The MCP handles the lookup (`list_offers`), the calculation, and the execution (`update_offer_price`) in one go. You just get the confirmation.

Getting Full Order Visibility with ManoMano

Before this MCP, figuring out what a pending order meant was painful. You'd see an alert for 'New Order,' click it, then open another tab to confirm the customer's address, and maybe check your spreadsheet to see if you had enough stock. It took three different actions just to understand one status update.

Now, tell your agent to run `get_order` on a specific order number. The MCP pulls in all that information—customer details, addresses, line items—and presents it to you instantly. You get the whole picture without opening a single extra browser tab.

ManoMano (Home Improvement Marketplace) – 11 Tools

Manage every aspect of your marketplace presence—from checking specific order details to updating inventory counts—using these 11 powerful tools.

#	TOOL	DESCRIPTION
01	<code>list_offers</code>	Retrieves a list of all active product offers currently published on ManoMano.
02	<code>get_offer</code>	Fetches specific, detailed information for one identified offer, including its price, stock count, and SKU.
03	<code>update_offer_price</code>	Changes the listed sale price of a specific product offer on ManoMano.
04	<code>update_offer_stock</code>	Sets a new available stock count for a particular published offer.
05	<code>list_orders</code>	Gathers a list of all orders received through the ManoMano platform.
06	<code>get_order</code>	Retrieves comprehensive details for a specific order, including customer addresses and every line item purchased.
07	<code>accept_order</code>	Changes the status of an order from pending to accepted within your seller account.
08	<code>ship_order</code>	Marks an order as shipped by providing a valid carrier name and tracking number.
09	<code>list_categories</code>	Provides a list of all root categories available in the ManoMano product catalog.
10	<code>list_brands</code>	Retrieves a directory of established brands listed on the ManoMano marketplace.
11	<code>list_fulfillment_stock</code>	Checks and reports current stock levels maintained by the external ManoFulfillment warehouse.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U List all ManoMano orders received today

I've retrieved 5 new orders. Highlights include Order #MM-123 (Amount: €45.00, Status: Pending) and Order #MM-456 (Amount: €120.00, Status: Accepted). Would you like to see the delivery address for the pending order?

U Update the stock for offer 'offer-987' to 50 units

Updating inventory... I've successfully set the stock for offer 'offer-987' to 50 units. Your listing on ManoMano is now synchronized with this new quantity. Would you like me to check the current price as well?

U Show me the stock levels in ManoFulfillment

Retrieving fulfillment stock... I've identified several items in the ManoMano managed warehouse. You have 150 units of SKU 'DRILL-01' and 45 units of SKU 'SAW-05'. No low-stock alerts detected for today.

Frequently Asked Questions

01 How do I check stock levels using ManoMano MCP?

You use ``list_fulfillment_stock`` to see what's currently held in the dedicated ManoFulfillment warehouse. This tool gives you an accurate count of your available inventory.

02 Can I update prices for multiple products with ManoMano MCP?

Yes. You don't have to list them one by one; you can tell the agent which product group needs a price adjustment, and it uses `update_offer_price` accordingly.

03 What is the difference between listing orders and getting an order?

Running `list_orders` gives you a summary of all recent activity. You use `get_order` when you need the full, deep details—like every single line item or the complete shipping address.

04 Do I need to know SKUs for ManoMano MCP?

While knowing an SKU helps, you can often reference offers by other identifiers. The agent is designed to handle different inputs when running tools like `get_offer` or `update_offer_stock`.

05 How do I mark a shipment as sent using ManoMano MCP?

You use the `ship_order` tool, making sure to provide both the carrier's name and the valid tracking number so the status updates correctly on the marketplace.
