MCP SERVER | NO CODE | CLOUD HOSTED

Meeting Cost Calculator MCP

Turn meeting schedules into clear financial data.

Meeting Cost Calculator MCP gives your AI client the ability to quantify the exact economic impact of your corporate meetings. Instead of guessing how much time and money is being spent in conference rooms, you can use this tool to run budget checks, compare different meeting scenarios, and determine the ideal number of participants to keep costs under control.

A+ Quality Score 100/100

meeting | cost | budget | efficiency | finance

MAINTAINED BY VINKIUS CLOUD FOR AI AGENTS · SEPTEMBER 2026

SCAN TO VIEW

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

> *The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.*
>
> — Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256	Ed25519	24h TTL	V8 Isolate
Encryption at rest	PKI vault signatures	Ephemeral session keys	Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

06 — Honeytoken Trap System

Phantom credentials are injected into isolated environments. If a honeytoken is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1) Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Meeting Cost Calculator MCP

4 tools available
Cloud-hosted on Vinkius

Stop treating meeting time as a free resource. This MCP turns your AI agent into a financial analyst that understands the real cost of every minute spent in a meeting. When you're planning a session, you can instantly see the total expenditure based on participant hourly rates. It's not just about knowing the cost of one meeting, though. You can use it to run through multiple scenarios at once to see how changing the duration or the attendee list shifts your bottom line. If you have a strict budget to stick to, the MCP can work backward to tell you exactly how many people can sit in the room before you go over. It's a practical way to bring fiscal discipline to your scheduling process without needing a separate spreadsheet or manual calculation.

Core Capabilities

01 — Scenario Comparison

Your agent compares multiple meeting setups to find the cheapest or most efficient option.

02 — Budget Enforcement

The AI checks if a proposed meeting duration and headcount fits within your financial limits.

03 — Attendee Optimization

Your agent calculates the exact headcount allowed for a specific budget.

04 — Single Session Auditing

The AI provides a precise dollar amount for any individual meeting you describe.

One Click on Vinkius — From Prompt to Execution

Available at **vinkius.com/en/ai-agent-connect/meeting-cost-calculator** — connect your AI agent in three steps.

01 Connect your MCP-compatible client to Vinkius.

02 Select the Meeting Cost Calculator from the catalog.

03 Describe your meeting details like duration, headcount, and rates to your AI agent.

04 The agent uses the tools to return specific cost or attendee data.

Getting this running is a one-time setup that gives your AI client immediate access to financial calculation tools.

Built For

This MCP is built for professionals who manage teams and need to keep operational costs transparent.

Operations Managers

They hand off meeting schedules to the AI to monitor departmental spending.

Project Managers

They use the tool to ensure project syncs don't drain the project budget.

Department Heads

They use the AI to audit meeting efficiency across their entire organization.

What Changes When You Connect

01 Converts meeting duration and headcount into direct dollar amounts.

02 Identifies the maximum number of participants allowed under a budget.

03 Compares multiple meeting configurations in a single request.

04 Validates meeting costs against pre-set financial thresholds.

Real-World Applications

Budget Planning

You tell your agent your budget, and it tells you how many people can attend a specific sync.

Meeting Audits

You check if a recurring weekly meeting is staying within the allocated departmental funds.

Scenario Modeling

You compare a 30-minute meeting with 20 people against a 60-minute meeting with 10 people.

Cost Transparency

You get a clear breakdown of the financial impact of a meeting to present to leadership.

Patterns to Avoid

Ignoring the hourly rate variance

AVOID

You assume every person in the meeting costs the same amount and run a single calculation for the whole group.

✓ INSTEAD

Use calculate_single_meeting_cost to account for the specific hourly rates of each individual attendee.

Guessing the maximum headcount

AVOID

You pick a number of attendees based on gut feeling and hope you stay under your departmental budget.

✓ INSTEAD

Run find_optimal_attendee_count to get the exact number of people allowed before you hit your limit.

Comparing meetings one by one

AVOID

You manually calculate five different meeting durations to see which one is cheapest.

✓ INSTEAD

Use batch_calculate_meeting_costs to compare multiple different scenarios in a single request.

The Right Fit

Connect this MCP if you manage budgets for teams or departments where meeting time represents a significant operational expense. Do not connect it if your meeting costs are negligible or if you don't track participant hourly rates. The decision rests on whether you need to justify meeting expenditures against a hard financial threshold.

Meeting Cost Calculator: 4 Precision Financial Tools

These tools convert meeting duration and participant rates into real-time budget data. Use them to audit single sessions or run large-scale scenario comparisons.

#	TOOL	DESCRIPTION
01	`batch_calculate_meeting_costs`	This tool runs cost calculations across a list of different meeting scenarios. Use it to compare how various durations or attendee counts affect your total spend.
02	`calculate_single_meeting_cost`	This tool finds the total financial cost for one specific meeting. It calculates the expense based on the number of people and their hourly rates.
03	`estimate_meeting_efficiency`	This tool checks if a meeting stays within your set budget. It evaluates whether the cost of the session is justified against your defined threshold.
04	`find_optimal_attendee_count`	This tool determines the maximum number of people who can attend a meeting without exceeding a specific budget limit.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U What is the cost of a 60-minute meeting with 10 people earning $50 per hour?

The total cost for this meeting is $500.00, with a cost of $50.00 per attendee.

U How many people can attend a 30-minute meeting if the average rate is $100/hr and my budget is $250?

You can have a maximum of 5 attendees for this meeting.

U Is a 45-minute meeting with 5 people at $60/hr within a $150 budget?

Yes, the meeting is within budget. The total cost is $75.00.

Frequently Asked Questions

01 **How do I use this MCP with Claude?**

You connect your Claude desktop app to Vinkius once. After that, you can simply ask Claude to calculate meeting costs using the tools provided by this MCP.

02 **Can I compare different meeting lengths?**

Yes. You can use the batch calculation tool to compare different durations or attendee counts in one go.

03 **Does this tool require me to provide hourly rates?**

Yes. To get an accurate cost, you need to provide the hourly rates for the participants involved.

04 **Can it tell me how many people can attend a meeting?**

Yes. The find_optimal_attendee_count tool calculates the maximum number of people allowed based on your budget.

05 **Is there a way to check if a meeting is over budget?**

Yes. The estimate_meeting_efficiency tool compares the calculated cost against a budget threshold you define.

06 **How is the meeting cost calculated?**

The cost is calculated by multiplying the number of attendees by the meeting duration (in hours) and the average hourly rate of the participants.

07 **Can I compare multiple meeting scenarios at once?**

Yes, you can use the `batch_calculate_meeting_costs` tool to process a list of different meeting configurations simultaneously.

08 **How do I know if my meeting is over budget?**

You can use `estimate_meeting_efficiency` to compare the calculated cost against your specific budget limit.

Go Live in 60 Seconds

Get your connection token from **cloud.vinkius.com**, then paste the endpoint URL into any MCP-compatible client.

YOUR MCP ENDPOINT
