CLOUD HOSTED

Meituan Waimai API MCP

Manage Live Orders & Store Status in Conversation

Meituan Waimai Open API / 美团外卖 connects your AI agent directly to China's top food delivery platform. Manage store status, confirm new orders, audit customer reviews, and track live courier progress—all through natural conversation. It takes the complexity of merchant portals and makes it conversational.

delivery-management

The infrastructure that powers AI agents in the real world.

Vinkius connects AI to the world's software through secure, enterprise-grade infrastructure — enabling real-world execution at scale, built on the Model Context Protocol (MCP).

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the cloud infrastructure where AI agents connect to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Meituan Waimai Open API / 美团外卖 MCP

10 tools available
Cloud-hosted on Vinkius

Your agent handles all the heavy lifting associated with running a modern restaurant operation on Meituan Waimai. You can ask your AI client to confirm if store information is up to date, or check what categories are available for listing new items. Need to know how busy you are? Your agent retrieves detailed metadata and lists recent orders instantly. If a customer leaves feedback, the system pulls those user ratings right into the conversation so you don't miss anything. It even lets your agent manage store visibility; tell it to open the shop or put it offline when needed. All this happens without you ever needing to log into the massive Meituan Merchant Portal and click through half a dozen pages just to get basic operational data. By connecting this MCP via Vinkius, your AI client acts as a dedicated, always-on operations assistant for your entire delivery workflow.

Core Capabilities

01 — Check store information

The tool retrieves current metadata about the physical store location and operational details.

02 — Manage online status

You can tell your agent to open or close the shop instantly, controlling its visibility on the platform.

03 — Handle incoming orders

The system confirms new orders and retrieves full details for any existing order ID.

04 — Track delivery progress

You can get a real-time status update on where the courier is relative to the destination.

05 — Review customer feedback

The agent pulls user comments and ratings, allowing you to monitor store performance by sentiment.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/meituan-waimai-open-api — connect your AI agent in three steps.

- 01 Subscribe to this MCP on Vinkius and input your Meituan Client ID and Secret credentials.
- 02 Connect the service to your preferred AI client, like Cursor or Claude.
- 03 Ask your agent a question about operations. For example: 'What's the delivery status for order XYZ?' The tool handles the API call and gives you a direct answer.

The bottom line is that your AI client uses this MCP to convert complex, multi-step operational tasks into single, natural language prompts.

Built For

This connector is for the Operations Manager who spends hours switching between dashboards and spreadsheets. It's for anyone whose job relies on knowing real-time status: whether a store needs to be opened, if an order was successfully confirmed, or where a delivery driver actually is right now.

Store Operations Manager

Using this MCP, they can monitor the entire day's flow. They ask their agent to check store metadata before opening up shop and then use it to list recent orders for end-of-day reconciliation.

Fulfillment Coordinator

They rely on this tool to audit delivery progress, knowing exactly where a courier is and if an order can be cancelled with the right reason code.

Retail Developer/DevOps Engineer

Developers use this MCP to build automated scripts that interact with live commerce data without needing manual API key management.

What Changes When You Connect

- 01 Stop manually checking dashboards. Using the agent, you can instantly get a full order status using `get_order_detail` without navigating multiple screens.

-
- 02** When labor hours are tight, use the tool to manage store visibility. Simply ask your agent to call `set_store_offline` when you close or `set_store_online` when you open up for business.
-
- 03** Audit performance by pulling customer sentiment. Instead of reading through physical comment cards, your agent gathers all user ratings via `get_store_comments` directly into the chat.
-
- 04** Manage the whole order lifecycle from a single prompt. You can confirm new orders using `confirm_order`, or use it to cancel an old one with specific reason codes via `cancel_order`.
-
- 05** Get full oversight of your business history. The agent can list recent orders, and you can filter them by date range using `list_recent_orders` for financial checks.
-

Real-World Applications

The Morning Prep Check

A manager needs to know if the store is ready before opening. Instead of checking the merchant portal, they prompt their agent: 'What's our current status?' The agent uses `get_store_info` and confirms if all necessary services are online.

End-of-Day Reporting

A finance worker needs a batch list of all orders from last Tuesday. They ask their agent to use `list_recent_orders` for a specific date range, getting the data compiled instantly for auditing.

The Logistics Crisis

A customer calls about a late delivery. Instead of calling the courier, the ops team asks their agent to use `track_delivery`. The agent immediately reports the driver's current location and estimated arrival time.

Handling New Business Needs

A menu planner wants to know what food types they can sell. Instead of browsing the site, they ask their agent to use `list_categories` and get a clean list of available selling categories.

Patterns to Avoid

Over-relying on basic web searches

✗ AVOID

Trying to find out if the store is open or what an order's final status is by just searching Google. You get general info, but zero actionable data.

✓ INSTEAD

Use this MCP. If you need operational status, ask your agent to ``get_store_info``. If you need a specific order update, use ``get_order_detail``.

Manual form submission

✗ AVOID

Having to log into the merchant portal every time you want to cancel an order or confirm one. It's slow and error-prone.

✓ INSTEAD

Let your agent handle it. Tell it to ``cancel_order`` with the necessary details, or use ``confirm_order`` for new sales—it does it in a single conversation.

Mixing up tasks

✗ AVOID

Asking one prompt that tries to get store info AND track delivery. The system often fails because the requests are too mixed.

✓ INSTEAD

Break it down. First, check metadata with ``get_store_info``. Then, separately ask the agent to use ``track_delivery`` for the specific order ID.

The Right Fit

Use this MCP if your job requires real-time access to active commerce data: managing order statuses, tracking deliveries, or updating store visibility. This tool is perfect for operational teams that need immediate answers about 'what happened' or 'where is it.' Don't use it if you are building a long-term CRM system; this MCP reads and acts on live transactional data. If your goal is to build a comprehensive customer profile database, connecting the raw order records into a dedicated analytics tool will be better. However, if your pain point is simply 'I need to know the status right now,' then this API provides immediate control over confirming new sales via `confirm_order` or getting current details with `get_order_detail`. It's an operational overlay, not a permanent data warehouse.

The Grind of Daily Operations

Right now, managing your food delivery business means jumping between five different interfaces. You check the physical terminal for new orders, then log into the portal to confirm them, switch tabs to see if a courier is late, and finally open a separate dashboard just to read customer comments about the meal. It's constant context switching.

With this MCP, you talk to your agent like it's an employee sitting next to you. You simply ask: 'What happened with order XYZ?' The system pulls everything—the live delivery status, the final details, and any recent user reviews—and gives you a single, accurate answer. It's instant operational intelligence.

Get Complete Order Visibility via Meituan Waimai API MCP

You no longer have to manually list recent orders across multiple spreadsheets or wait for reports. You tell your agent to run a report using `list_recent_orders` and it handles the filtering, providing you with actionable data immediately.

This changes everything about workflow speed. Instead of spending 20 minutes compiling an order audit sheet at the end of the day, you get accurate data on demand, making instant decisions possible.

Meituan Waimai Open API / 美团外卖 (10 Tools)

Use these ten tools to control every aspect of store operations, from checking metadata and listing categories to tracking live deliveries.

#	TOOL	DESCRIPTION
01	<code>cancel_order</code>	Cancels an order and requires a specific reason code for the action.
02	<code>confirm_order</code>	Confirms that a new, pending order has been accepted by the store.
03	<code>get_order_detail</code>	Retrieves all specific information about an existing order ID.
04	<code>get_store_comments</code>	Fetches a list of user reviews and comments left for the store location.
05	<code>get_store_info</code>	Retrieves general, high-level operational metadata about the store's current status.
06	<code>list_categories</code>	Provides a full list of food categories available for selling.
07	<code>list_recent_orders</code>	Generates a filtered list of all orders that occurred within a specified time range.
08	<code>set_store_offline</code>	Changes the store's status to offline, making it invisible on the platform.
09	<code>set_store_online</code>	Restores the store's visibility and sets its operational status back to online.
10	<code>track_delivery</code>	Provides a current, real-time update on the location and progress of an active delivery.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Show me the details for order 'ORD_88210934'.

I've retrieved the details for order `ORD_88210934`. The total is 45.50 CNY. It includes 2x Beef Noodles and 1x Coke. The customer is located at 'Room 101, Bld 5, Shanghai Garden'. Would you like me to confirm this order now?

U Check the delivery status for the active order.

I've checked the delivery progress. The courier, 'Zhang Wei', has picked up the order and is currently 1.5 km away from the destination. Estimated delivery time is in 8 minutes.

U Open my store 'STORE_8821' for new orders.

Done! I've updated the status for store `STORE_8821` to 'Online'. You are now visible on the Meituan app and ready to receive new orders. Would you like me to list any pending orders?

Frequently Asked Questions

01 How does Meituan Waimai Open API / 美团外卖 handle store status?

It lets your agent control whether the shop is visible to customers. You can use ``set_store_offline`` when you close and ``set_store_online`` when you open, ensuring accurate service availability.

02 Can I get details for a specific order with Meituan Waimai Open API / 美团外卖?

Yes. You use the agent to call ``get_order_detail`` and provide the order ID, receiving all metadata—items, total cost, customer address—in one go.

03 Does this MCP help with tracking deliveries? (Meituan Waimai Open API / 美团外卖)

Absolutely. You ask the agent to use ``track_delivery``, and it provides a real-time location update, telling you how far away the courier is and when they'll arrive.

04 What if I need to cancel an order using Meituan Waimai Open API / 美团外卖?

You ask your agent to ``cancel_order``. It handles the process and requires you to specify a reason code, which is crucial for auditing purposes.

05 Can I check customer reviews with Meituan Waimai Open API / 美团外卖?

You can use ``get_store_comments`` to pull current user ratings and comments. This lets you monitor customer satisfaction directly within your agent chat.
