

MCP SERVER

NO CODE

CLOUD HOSTED

Notion Alternative MCP

Query and manage your entire knowledge base via chat.

Notion Alternative connects your AI agent directly to your entire Notion workspace. Search every page and database, query structured data with filters, create new records, update properties on demand, or append blocks of content—all through natural conversation.

A+ Quality Score 98.33/100

workspace

api-integration

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Get started at cloud.vinkius.com — connect your AI agent in under 60 seconds.

Notion MCP

13 tools available
Cloud-hosted on Vinkius

Your AI client can now treat your Notion workspace like a dedicated knowledge ops assistant. Instead of clicking through multiple tabs to find a specific project status or document owner, you talk to it. It reads all the data and executes changes directly. You can search across every page title and database name to instantly pinpoint what you need. Need to update a task's priority or add notes to a review? Just ask your agent. When you connect this MCP via Vinkius, your AI acts as an extension of your brain, giving you full control over pages, databases, and content without ever leaving your chat window.

Core Capabilities

01 — Search the entire workspace

Find specific pages or databases by title across all accessible areas.

03 — Create new entries and pages

Generate brand new items in databases or create entirely new pages within your workspace structure.

05 — Read and append content blocks

Pull the detailed text, headings, and lists from a page's body, or add new paragraphs and elements to existing content.

02 — Query structured database records

Retrieve lists of rows from a database, applying filters and sorting rules like you would in the actual Notion interface.

04 — Modify page properties

Update specific metadata fields on a page, such as changing its status or setting its priority level.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/notion-alternative — connect your AI agent in three steps.

- 01 Subscribe to this MCP and provide your Notion Internal Integration Token.
- 02 Connect the MCP to your preferred AI client (Claude, Cursor, etc.).
- 03 Tell your agent what you need. For example: 'Find all tasks assigned to Sarah that are over budget.' The agent runs the query and gives you a list of results.

The bottom line is that your AI can interact with Notion using natural language commands, acting as if it's logged in and clicking everything for you.

Built For

This MCP is for the Knowledge Manager drowning in interconnected documents. It's for the developer who needs to update project status without opening a browser tab. If your job involves tracking complex, structured data across multiple internal resources, you need this.

Knowledge Manager

Needs to search vast archives of meeting notes and documents instantly by title or content, pulling out relevant details without manual searching.

Project Coordinator

Requires the ability to list database rows filtered by status (e.g., 'In Review') and then update their priority property in a single chat prompt.

Software Developer

Needs to read specific page content blocks or create new development tasks directly into the project tracker without switching applications.

What Changes When You Connect

- 01 Instead of opening Notion, navigating to a database, and manually applying filters, you simply ask the agent to 'Show me all tasks that are stalled.' The agent uses `list_database_rows` to give you an immediate summary.

-
- 02** When you need to update information—say, changing a project's status from 'Draft' to 'Review'—you use `update_page`. This saves the manual process of opening the page and clicking through property drop-downs.
-
- 03** You don't just read data; you write it. Use `create_database_row` when you need to log a new meeting or task, ensuring all necessary fields are populated correctly without leaving your chat client.
-
- 04** Need context on what was said about a document? The agent can use `list_comments` to summarize the discussion thread, pulling historical feedback from pages instantly.
-
- 05** The ability to read underlying content via `get_page_blocks` means you don't just get the page title; you get the actual text and structure of the content for analysis or summarization.
-

Real-World Applications

Finding old meeting notes from a specific person.

A PM needs to check what was decided about 'Project X' last quarter. They ask their agent, 'Search the workspace for 'Project X' and filter by user ID 123.' The agent uses `search` and then filters results using `list_database_rows`, giving them a curated list of pages.

Summarizing feedback on an article.

A content lead wants to know all feedback on a draft. They ask their agent to 'List all comments on the Marketing Strategy page.' The agent uses `list_comments`, aggregating the discussion thread without manual review.

Creating follow-up tasks after a client call.

After a call, the developer doesn't want to open Notion. They simply prompt: 'Create a new task for Q3 planning and set its status to To Do.' The agent runs `create_database_row` instantly, logging the task with proper properties.

Updating project status across multiple records.

The team lead needs to mark five different tasks as complete. Instead of opening them one by one, they tell the agent: 'Update pages 45-50 and set their Status property to Complete.' The agent executes `update_page` for all IDs.

Patterns to Avoid

Trying to read everything on a page at once.

X AVOID

A user tries to copy-paste an entire Notion page into another tool, but loses the structure (headings vs. paragraphs) or gets cut off after the first few blocks of text.

✓ INSTEAD

Use the agent's ``get_page_blocks`` tool. This reads the full structural content block by block, preserving headings and lists so your AI client can understand the whole document correctly.

Updating a page using only its title.

X AVOID

The user tells the agent: 'Set Project Alpha status to Done.' The agent fails because it needs a precise ID, not just a descriptive name.

✓ INSTEAD

Always use ``search`` first to get the exact Page ID. Then, pass that ID along with your requested changes using the ``update_page`` tool.

Assuming all database properties are visible.

X AVOID

A user tries to query a property called 'Budget' but doesn't know if it was set up as text or a number field, causing the query to fail unexpectedly.

✓ INSTEAD

First, use the ``get_database`` tool. This reveals the database schema and confirms exactly what properties exist and what type of data they require.

The Right Fit

Use this MCP if your workflow requires AI interaction with structured knowledge—meaning you don't just need to read a document, you need to *manage* it. If you constantly find yourself in Notion doing repetitive tasks like 'finding the status of X,' or 'adding metadata Y to Z,' this is for you. Don't use this if your only goal is simple text summarization; then a generic document analysis tool might suffice. You must use `list_database_rows` when you need structured lists with filters, not just searching by keyword. If you just want to browse and read general content without modifying it, the basic search function is enough. But if you need to write or change anything, this MCP is required.

The hassle of moving knowledge out of Notion.

Right now, getting data from your internal wiki is a mess. You have to open the desktop app, manually search through multiple databases, click into various pages just to find one property value, and then copy that information into a spreadsheet or chat window. It's clicking, tab-switching, and painful context switching.

With this MCP, you talk to your agent. Instead of leaving your conversation interface, you simply ask: 'What was the budget status for Q4?' The AI runs the query against all your databases and gives you a single, direct answer—no clicks required.

The Notion Alternative MCP allows full control over page content.

Manual updates usually require opening the page, scrolling to the section, finding the correct property box (like 'Status'), and clicking a dropdown. If you miss one click or navigate away from the right view, the update fails or goes wrong.

Now, your agent handles it. You tell it: 'Change Project Alpha's status to Done.' The MCP runs `update_page` in the background, updating only that property on the correct page ID. It's precise, repeatable, and faster than any manual process.

Notion Alternative: 14 Tools for Knowledge Management

These tools allow your AI client to perform specific actions across your Notion workspace, giving you granular control over reading, writing, and organizing all your content.

#	TOOL	DESCRIPTION
01	<code>append_block</code>	Adds structured content, like headings or paragraphs, to an existing Notion page.
02	<code>create_comment</code>	Posts a new discussion comment thread directly onto a specific Notion page.
03	<code>create_database_row</code>	Adds a brand new, structured record (a row) to a designated database.
04	<code>get_database</code>	Retrieves the schema and details for a specific Notion database, showing what properties it tracks.
05	<code>get_me</code>	Verifies your connection by listing the bot identity that the AI agent will use when making changes.
06	<code>get_page</code>	Retrieves basic metadata and details for a specific Notion page ID.
07	<code>get_page_blocks</code>	Reads the full, granular content of a page, including every paragraph, heading, or list item.
08	<code>get_user</code>	Fetches detailed information about a specific user within your Notion workspace.
09	<code>list_comments</code>	Gathers all comment threads associated with a particular page or block of content.
10	<code>list_database_rows</code>	Queries and returns multiple records from a database, allowing you to filter by status or sort results.
11	<code>list_users</code>	Lists all user accounts in your Notion workspace, including their names and IDs.
12	<code>search</code>	Searches for pages or databases across the entire workspace by title, helping you find content before querying it further.
13	<code>update_page</code>	Changes specific properties of an existing Notion page, like changing its status or setting a new due date.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Search for all pages related to 'Q4 planning'.

I found 3 pages matching 'Q4 planning': 'Q4 OKRs' (database), 'Q4 Budget Review' (page, last edited 2 days ago) and 'Q4 Team Retrospective' (page, last edited last week). Would you like to see the content of any of these?

U Query my Task Tracker database and show me all items with status 'In Progress'.

I found 12 tasks with status 'In Progress' in your Task Tracker database. The highest priority items are 'Implement OAuth flow' (due tomorrow), 'Fix checkout bug' (due today) and 'Update API documentation' (no due date). Want me to show all 12?

U Add a new task to my Task Tracker called 'Review PR #234' with status 'To Do'.

Done! I've created a new page 'Review PR #234' in your Task Tracker database with status set to 'To Do'. The page URL is notion.so/your-workspace/... You can add more properties or blocks to it anytime.

Frequently Asked Questions

01 How do I search for content using the Notion Alternative MCP?

You use the `search` tool to find pages or databases by title. This is useful when you aren't sure of the exact location, allowing your agent to give you a list of potential matches first.

02 Can I update multiple records with Notion Alternative MCP?

Yes. You use ``update_page`` and provide the specific IDs for each page you want to change along with the new properties, allowing batch updates in one command.

03 What is the difference between `list_database_rows` and `search`?

Use ``search`` when you need to find a general document or database by name. Use ``list_database_rows`` when you already know the database and need to filter its contents using structured criteria, like `status='Complete'`.

04 Does Notion Alternative MCP only read data?

No, it can write data too. You can use ``create_database_row`` to add new tasks or use ``append_block`` to add paragraphs of content directly into a page.

05 How do I check who has access to my Notion workspace?

Run the ``list_users`` tool. This fetches a comprehensive list of every user account in your workspace, giving you their ID and name for reference.
