CLOUD HOSTED

OpenCorporates MCP

Audit Global Corporate Records in Conversation

OpenCorporates MCP provides direct access to one of the world's largest open databases of company records and global corporate officers. Use your AI agent to perform deep due diligence, running complex audits by searching across hundreds of jurisdictions instantly. It lets you audit business registrations and track ownership structures without manually filling out forms or browsing regional government websites.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

OpenCorporates MCP

6 tools available

Cloud-hosted on Vinkius

OpenCorporates connects your agent directly to a massive database of company information worldwide. This MCP turns tedious corporate research into simple conversation. Instead of needing to visit dozens of national registries, your AI client searches across global jurisdictions to find specific companies and their directors. You can ask it to audit an entire corporate structure or track down the history of an officer associated with multiple entities. It gathers detailed metadata—like official registration numbers and current status—allowing you to build a complete picture of ownership groups instantly. If you're running competitive analysis or just doing general background checks, your agent acts like a real-time investigator, grounding all your business intelligence in verified data. It's the kind of resource that makes Vinkius such a valuable catalog for professional research.

Core Capabilities

01 — Search Global Companies

Find company records by name or keyword across multiple international jurisdictions.

03 — Map Ownership Structures

Get details on complex corporate groupings to understand who owns what, instantly.

05 — Verify API Usage

Monitor your research volume by checking the current usage status of your access token.

02 — Identify Corporate Officers

Locate and audit the history of directors and corporate officers tied to specific entities.

04 — Check Jurisdictional Reach

List and query all supported countries and jurisdictions in the database.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/opencorporates — connect your AI agent in three steps.

- 01 Subscribe to this MCP and provide your OpenCorporates API Token in Vinkius.
- 02 Connect this MCP via any compatible client, like Claude or Cursor.
- 03 Ask your agent a question, such as 'Find all companies related to XYZ in Germany.' The agent executes the necessary lookups and returns structured data.

The bottom line is you get verified corporate intelligence delivered directly into your workflow using natural language prompts.

Built For

Due Diligence Analysts, legal researchers, and journalists use this when they face massive amounts of complex, scattered international data. They are tired of manually cross-referencing dozens of country-specific registry websites just to confirm a company's status or ownership.

Due Diligence Analyst

Runs full audits on potential investments by searching for companies and retrieving official metadata across multiple jurisdictions in one query.

Legal Researcher

Verifies the corporate status of opposing parties or clients, using the tool to audit officer histories without having to export manual registry reports.

Journalist

Performs rapid background checks on individuals and companies by querying for officers and grouping intelligence related to ownership markers.

What Changes When You Connect

-
- 01 Quickly determine a company's existence and status. Instead of navigating complex national websites, use the `search_companies` tool to find records across hundreds of jurisdictions with a single prompt.

 - 02 Track ownership structures instantly. The `get_corporate_grouping` tool reveals complex relationships between entities, eliminating days of manual chart drawing and cross-referencing.

 - 03 Audit key personnel history. Use `search_officers` to build comprehensive profiles of directors, seeing their roles across multiple companies without lifting a finger.

 - 04 Maintain control over your research volume. The `get_api_status` tool lets you monitor usage in real time, so you never hit an unexpected rate limit mid-audit.

 - 05 Understand global scope immediately. Run `list_jurisdictions` to know exactly which countries are covered before starting any investigation.
-

Real-World Applications

Verifying a Target Company's Status

A client needs to vet an investment target in France and Brazil. Instead of checking two separate national registries, they ask their agent to search `companies` for the entity across both jurisdictions. The agent returns the full metadata using `get_company_details`, giving them instant verification.

Tracing Hidden Ownership Chains

A journalist suspects a major corporation is controlled by multiple smaller shell companies. They use `search_companies` to find the initial entity, then prompt the agent with `get_corporate_grouping` to map out all related owners and subsidiaries.

Background Check on an Executive

A legal team needs to confirm if a key executive has worked for any other companies in the tech sector. They run `search_officers`, quickly identifying every director named John Smith across multiple jurisdictions and getting their associated company details.

Pre-Acquisition Due Diligence

An M&A team needs to know if a target's directors have any overlapping interests. They use `get_corporate_grouping` on the main entity, which instantly highlights all shared ownership links and related parties.

Patterns to Avoid

Using it for general web search

✗ AVOID

Asking the agent to 'Find out what the weather is like in London' or 'What are the best restaurants near me.'

✓ INSTEAD

This MCP only deals with registered corporate and legal data. Stick to specific queries, like using `list_jurisdictions` first, then `search_companies` for a name within one of those listed countries.

Assuming live operational data

✗ AVOID

Thinking the agent can pull internal HR records or non-public financial statements.

✓ INSTEAD

The tool accesses public open databases. For sensitive, private documents, you need manual input; use `search_companies` and `get_company_details` for official, publicly verifiable metadata only.

Trying to verify a fake company name

✗ AVOID

Submitting an obvious misspelling or non-existent jurisdiction and expecting results.

✓ INSTEAD

Start by listing all supported jurisdictions using `list_jurisdictions`. If the source country isn't listed, the agent won't be able to search for it.

The Right Fit

Use this MCP if your core task involves auditing corporate records or performing background checks that span multiple international legal systems. You need verifiable details like registration numbers or officer histories, and you want an AI agent to handle the complexity of global data retrieval. Don't use it if you are simply looking for general business news, market trends, or operational

contact information; those require different sources. If your goal is purely internal document drafting, stick to text editors. But if you need to know *who* owns a company and *where* they are registered globally, this MCP is what you need.

The Pain of Global Corporate Auditing

Today, auditing a single corporate structure means jumping between dozen different government registry websites. You copy-paste company names into one site to get the registration number; then you take that number and paste it into another site to find officers. If the target operates in five countries, you spend days just connecting those dots.

With this MCP, your agent handles all that legwork. Instead of copying data across tabs or waiting for manual exports, you simply ask your agent to audit a multinational entity. It runs through its systems, collects official metadata from multiple global sources, and gives you one clean answer.

OpenCorporates: Direct Access to Company Data

The biggest time sink is the manual process of checking officer names or ownership links. You'd search for a person, find their name in one registry, then have to manually cross-reference that name against another company's board list.

Now, you ask your agent to `search_officers` and `get_corporate_grouping` together. It instantly finds all related entities and officers across the globe. You don't just get a list; you get the full context of the relationship.

OpenCorporates: 6 Tools for Corporate Intelligence

These tools allow your agent to search, verify, and map complex relationships between companies and officers using official open corporate databases.

#	TOOL	DESCRIPTION
01	<code>get_company_details</code>	Fetches all information for a specific company using its jurisdiction and registration number.
02	<code>get_corporate_grouping</code>	Retrieves detailed records showing the complex relationships within corporate ownership groups.
03	<code>get_api_status</code>	Checks your current API token usage and overall account metadata limits.
04	<code>list_jurisdictions</code>	Provides a complete list of all countries or regions supported by the database.
05	<code>search_companies</code>	Searches for potential companies using keywords or general names across global locations.
06	<code>search_officers</code>	Finds and lists corporate officers and directors associated with specific entities.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Search for companies named 'Vinkius' using OpenCorporates.

I've retrieved several companies named Vinkius. Notable matches include entities in Brazil and Europe. Would you like the full registration metadata for any specific jurisdiction?

U Show company details for 'google' in jurisdiction 'us_de' (Delaware).

I've identified Google in Delaware. The company number is 2838522. I can retrieve the full list of officers and corporate groupings for this entity if you'd like.

U Find corporate officers named 'John Smith'.

I've identified several officers named John Smith across various jurisdictions. Notable roles include directors in tech and finance sectors. Would you like the company details for any specific match?

Frequently Asked Questions

01 How does OpenCorporates MCP find company details?

It connects to an open, global database that aggregates official records from hundreds of jurisdictions. You can use `get_company_details` with a specific jurisdiction and number.

02 Can I find officers for companies not in the US?

Yes. OpenCorporates supports multiple international jurisdictions. Start by running `list_jurisdictions` to see which countries are covered before searching for directors using `search_officers`.

03 What is a corporate grouping and how do I use it?

A corporate grouping reveals complex ownership structures—the web of parent/subsidiary companies. Use the `get_corporate_grouping` tool to map these relationships instantly.

04 Is OpenCorporates MCP for real-time market pricing?

No, this MCP is strictly for corporate records and legal entity data. It cannot provide live stock prices or financial statements; its focus is on verified organizational structure.

05 What if I don't know the company number?

You can still start by using `search_companies` with a name or keyword. The initial results will give you jurisdictional options, and then you can get the full details using `get_company_details`.
