Pet Sitter Cost Calculator MCP

Get exact pet sitting quotes and pricing comparisons instantly.

Pet Sitter Cost Calculator MCP handles the math for pet care pricing. Your AI client uses it to pull base rates, calculate flat fees, or apply volume discounts for long stays. It makes comparing different booking options simple so you can see exactly where the savings are.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Pet Sitter Cost Calculator MCP

4 tools available

Cloud-hosted on Vinkius

You can stop manually calculating pet care expenses. This MCP gives your AI client the specific tools needed to handle pet sitting math, whether you are looking at a single night or a multi-week stay. If you need to know what a specific sitter charges, your agent can pull their base rate immediately. For standard bookings, it calculates the total cost based on daily rates. If you are planning a longer trip, the MCP can apply tiered pricing models to account for volume discounts. You can also ask your agent to compare different booking options to see if a tiered discount actually saves you money compared to a standard flat rate. It turns your AI into a precise financial tool for pet care planning.

Core Capabilities

01 — Base Rate Retrieval

Your agent pulls specific daily rates for individual sitters.

02 — Flat Rate Calculation

The AI calculates total costs for short-term or standard bookings.

03 — Volume Discounting

The MCP applies tiered pricing for extended pet care durations.

04 — Price Comparison

Your agent compares standard and tiered totals to find the cheapest option.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/en/ai-agent-connect/pet-sitter-cost-calculator — connect your AI agent in three steps.

- 01
- Connect the MCP to your client like Claude or Cursor via Vinkius.
- 02
- Ask your AI agent for a sitter's base rate.
- 03
- Request a total cost calculation for a specific number of days.
- 04
- Use the comparison tool to check for tiered discount savings.

Connecting this MCP to your AI client gives your agent immediate access to pet care pricing tools.

Built For

This MCP is built for anyone managing pet care logistics or pet sitting business finances.

Pet Owners

They use the AI to budget for upcoming trips and compare sitter costs.

Pet Sitters

They use the tools to generate accurate quotes and apply discounts for long-term clients.

Pet Care Agency Managers

They use the comparison tools to manage pricing models across different sitters.

What Changes When You Connect

- 01
- Eliminates manual math errors in pet care budgeting.
- 02
- Automates the application of volume discounts for long stays.
- 03
- Provides instant comparisons between different pricing structures.

04 Centralizes sitter rate information for quick access.

Real-World Applications

Vacation Budgeting

A pet owner asks their AI to calculate the total cost for a week of sitting before booking.

Cost Optimization

An agent compares standard and tiered rates to see if a longer stay qualifies for a discount.

Sitter Quote Generation

A pet sitter uses the MCP to provide a client with a tiered price for a 14-day stay.

Rate Auditing

A manager checks the base rates of multiple sitters to ensure pricing consistency.

Patterns to Avoid

Manual Math Guesswork

❌ AVOID

You try to estimate a two-week stay by multiplying a daily rate in your head and hoping you didn't miss a discount.

✓ INSTEAD

Let your agent handle the math by using ``calculate_tiered_total`` to apply volume discounts automatically.

Ignoring Discount Tiers

❌ AVOID

You book a long-term stay at a flat rate without checking if a cheaper option exists.

✓ INSTEAD

Run ``compare_booking_options`` to see if switching to a tiered model saves you money.

Using Outdated Rates

❌ AVOID

You rely on a rate you saw last month instead of checking what a sitter actually charges today.

✓ INSTEAD

Always use ``get_base_rate`` to pull the current, specific daily rate for the sitter you are considering.

The Right Fit

Connect this MCP if you manage pet care budgets, run a sitting business, or need to compare sitter pricing models. Do not connect it if you only need a simple calculator that doesn't account for volume discounts or specific sitter rates.

Pet Sitter Cost Calculator 4 Tools

These tools handle everything from pulling individual sitter rates to comparing complex tiered pricing models.

#	TOOL	DESCRIPTION
01	calculate_standard_total	This tool computes the total price for a booking using a flat daily rate. It is used for standard, non-discounted stays.
02	calculate_tiered_total	This tool calculates the total cost for long-term stays using volume-based discounts. It applies tiered pricing to the booking duration.
03	compare_booking_options	This tool compares the costs between standard pricing and tiered pricing. It shows the exact difference in savings between the two models.
04	get_base_rate	This tool retrieves the standard daily rate for a specific pet sitter. It provides the foundation for all other cost calculations.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U How much will it cost for sitter 123 to watch my pet for 5 days at the standard rate?

The total cost for sitter 123 for 5 days at the standard rate is \$150.00.

U What is the base rate for sitter 456?

The standard daily rate for sitter 456 is \$45.00.

U Compare the costs for sitter 789 for a 10-day stay.

For a 10-day stay with sitter 789, the standard total is \$400.00 and the tiered total is \$350.00, resulting in \$50.00 in savings.

Frequently Asked Questions

01 How do I use this MCP with Claude?

You connect to the MCP through the Vinkius platform. Once connected, your Claude client can immediately call the pricing tools.

02 Can I calculate discounts for long stays?

Yes. The `calculate_tiered_total` tool is designed specifically to apply volume discounts for longer durations.

03 Does this MCP handle multiple sitters?

Yes. You can pull base rates and calculate totals for different sitters by providing their specific IDs to your agent.

04 What is the difference between standard and tiered pricing?

Standard pricing uses a flat daily rate. Tiered pricing applies discounts as the length of the stay increases.

05 Do I need to host this myself?

No. Vinkius hosts and manages the MCP for you. You just connect your client and start using the tools.

06 How do I find out how much a sitter charges per day?

You can use the ``get_base_rate`` tool by providing the specific sitter's ID.

07 Can I compare different booking methods?

Yes, the ``compare_booking_options`` tool allows you to compare the total cost of a standard booking against a tiered booking for the same duration.
