The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

PitchBook MCP

13 tools available

Cloud-hosted on Vinkius

Need to know who funded a startup or how much money an investment bank is spending right now? This MCP connects your agent to PitchBook's extensive data library. Instead of digging through dense reports or jumping between multiple financial databases, you ask your AI client a question in plain language and get structured answers back. You can run due diligence on companies by checking their complete history—who funded them, how much they raised, and when. You track the full deal lifecycle, from initial VC investment to potential acquisition, all while analyzing key players like venture firms and limited partners. The information returned is clean market data that you can immediately use in your work. By connecting this MCP via Vinkius, your agent gets access to 4,000+ specialized tools, making it a single source for complex financial research.

Core Capabilities

01 — Profile Companies

Retrieve detailed background information on companies, including their founding date, industry sector, and key employees.

03 — Research Deals and Transactions

Get detailed records of specific deals, whether they are M&A transactions, public offerings, or private venture investments.

05 — Analyze Professional Networks

Find and research key people like founders, board members, or executives involved in specific companies or deals.

02 — Map Funding History

Analyze a company's entire capital raise history, noting the amount raised, lead investors, and valuation for every financing round.

04 — Identify Capital Sources

List and profile investors, investment funds, and limited partners to map the flow of money in the market.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/pitchbook — connect your AI agent in three steps.

- 01 Connect your PitchBook account to the MCP using an API token from your Direct Data subscription.
- 02 Tell your AI agent what you need—for example, 'Find Series A funding for biotech companies in Boston.'
- 03 The agent executes the necessary tools and returns formatted market data that answers your specific question.

The bottom line is that your agent uses structured commands to perform deep financial research without you ever having to touch a spreadsheet or navigate multiple web portals.

Built For

This MCP is essential for anyone whose job relies on understanding where money moves. It's for the investment professional who can't afford to spend hours manually compiling deal flow, or the corporate developer needing immediate background checks.

Venture Capital Partner

Uses it to track competitor fundraising rounds and assess the exit probability of potential portfolio companies.

Investment Banker

Runs deep diligence on target companies or potential investors, compiling full profiles and financing histories rapidly.

Corporate Development Manager

Identifies potential acquisition targets by researching company structures, key decision-makers, and deal history.

What Changes When You Connect

-
- 01 Map complex funding relationships: Using `get_company_financing` shows you the entire capital stack of a company, from initial seed money to major Series D+ rounds. You see exactly who invested and how much.

 - 02 Perform instant due diligence: With `get_professional`, your agent pulls up a complete background on any person—founder, executive, or board member—so you don't have to run multiple searches.

 - 03 Track market movement: The `get_deals` tool allows you to monitor recent M&A activity across specific industries, letting you identify which sectors are currently hot for acquisitions.

 - 04 Predict future outcomes: Running the `get_vc_exit_predictor` provides an AI-powered probability score on whether a portfolio company is likely to go public or be acquired next. It's predictive risk assessment.

 - 05 Scope the capital pool: Use `get_investors` and `get_funds` together to quickly map out which firms are most active in your sector, letting you target potential sources of investment.
-

Real-World Applications

Assessing a Potential Acquisition Target

A corporate developer needs to know if 'Acme Corp' is ready for sale. They ask the agent to run `'get_company'` and then use `'get_vc_exit_predictor'`. The results provide not only the company profile but also an assessed probability score for IPO or M&A, giving immediate strategic insight.

Mapping a Sector's Key Players

A VC wants to know who is funding AI startups in Q3. They use `'get_investors'` to filter by sector and then cross-reference the results with `'get_deals'` to see which firms were most active, saving days of manual research.

Verifying a Founder's Background

A consultant needs to vet an executive. They use `get_professionals` to find the person and then run `get_company_financing` on that company to see if the founder was involved in previous major funding rounds, validating their network.

Understanding LP Allocation Trends

An investment manager needs to understand who is committing capital. They use `get_limited_partners` to list potential pension funds and then run `get_funds` to see what types of funds those LPs typically invest in.

Patterns to Avoid

Searching for general industry info

X AVOID

Using a standard web search engine to ask, 'What are the top 5 most active PE firms in healthcare?' This yields vague articles and lists that aren't structured data.

✓ INSTEAD

Use `get_investors` with filters like 'PE' and 'Healthcare' to get a clean list. Then use `get_deals` to narrow down their recent activity, getting hard numbers on deal size instead of fluff.

Trying to link company data manually

X AVOID

Finding a company name from Google and then having to copy the ID into a separate database to find its funding history. This is slow and prone to errors.

✓ INSTEAD

Use `get_companies` first to get a list of IDs, then pass those resulting IDs directly to `get_company_financing` in one prompt to analyze all histories at once.

Asking for future predictions vaguely

X AVOID

Asking an agent general questions like 'Will this company succeed?' The response will be theoretical and lack concrete data sources.

✓ INSTEAD

Ask the specific predictive question: 'What is the predicted exit probability for [Company ID]?'. This triggers `get_vc_exit_predictor` and gives a score based on historical comps.

The Right Fit

Use this MCP if your primary need is deep, structured financial intelligence about private markets. If you are building an investment thesis, tracking capital flow, or performing due diligence on corporate targets, this tool set is necessary. You must be able to define the scope: a specific industry, geographic area, deal type, or time frame. Don't use it if your question is general ('What's

trending?') or requires subjective opinion outside of verifiable data points. If you just need basic news articles about an event, a standard search engine works fine. But when you need to know *who* funded the company, *how much*, and *when*, only this MCP delivers the necessary structured depth.

Gathering Market Intelligence Used to Take Weeks of Spreadsheets

Today, gathering deep market intelligence means cross-referencing multiple sources. You pull a company name from one site, then open another database to check its funding rounds. You copy IDs into spreadsheets, manually filter by deal type (M&A vs. VC), and spend hours stitching together profiles of investors with limited partners.

With this MCP, you simply ask your agent: 'Show me all Series B deals in the energy sector from 2022 to today.' The system handles the complex filtering across company profiles, deal records, and investor lists, returning a clean, actionable data set instantly.

PitchBook MCP Delivers Structured Company Data

The manual steps that disappear are the constant tab-switching between company profiles, financing trackers, and deal flow lists. You eliminate the need to copy IDs across different systems just to build a single timeline of events for one organization.

Now you get a cohesive view. It's not just data; it's a complete historical record that tells the story of the company's growth from its first check to its current valuation.

PitchBook MCP: 13 Tools for Financial Research

These tools allow your agent to perform highly specific actions, letting you research company profiles, deal structures, investor networks, and professional backgrounds with pinpoint accuracy.

#	TOOL	DESCRIPTION
01	<code>get_companies</code>	Search the database to list companies based on criteria like industry, status (Active/Closed), or location.
02	<code>get_company_financing</code>	Analyze a specific company's entire funding history, including dates, amounts, and lead investors for each round.
03	<code>get_company</code>	Retrieve the detailed background profile for any single company in PitchBook.
04	<code>get_deal</code>	Get full details on a specific transaction, including all participating companies and investors involved in the deal.
05	<code>get_deals</code>	Search for recent deals by type (M&A, IPO, VC Deal) or date range to track market activity.
06	<code>get_fund</code>	Get detailed information about a specific investment fund's strategy and structure.
07	<code>get_funds</code>	List and filter investment funds by vintage year, size, or type to analyze market capital deployment trends.
08	<code>get_investor</code>	Get a detailed profile of an investor firm, including its focus areas and notable portfolio companies.
09	<code>get_investors</code>	Search for investors (VC firms, Angels) by type or location to map the investment landscape.
10	<code>get_limited_partners</code>	List limited partners by type or total commitment size for LP fundraising research.
11	<code>get_professional</code>	Retrieve the detailed profile of a specific individual, such as a founder or board member.
12	<code>get_professionals</code>	Search and list key people in the ecosystem by title, organization, or location.
13	<code>get_vc_exit_predictor</code>	Run an analysis to predict a company's likelihood of exiting via IPO or acquisition.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Search for artificial intelligence startups that raised a Series A round in the last 6 months.

I have retrieved the latest funding data for AI startups via PitchBook, highlighting companies such as [Company Name] and detailed valuations.

Frequently Asked Questions

01 How do I use PitchBook MCP to find out who invested in a specific startup?

You can track funding by using ``get_company_financing``. You provide the company ID, and the tool returns all participating investors, along with the deal size for each round.

02 Can PitchBook MCP predict if a company will have an IPO?

Yes. Run the ``get_vc_exit_predictor`` tool on a company ID. This provides a score and predicts the likelihood of exit via IPO or acquisition, helping assess potential.

03 What if I want to research multiple investors at once?

Use ``get_investors`` to list many firms by type (e.g., PE). Then you can use the resulting firm names with other tools, like checking their deal activity via ``get_deals``.

04 Does PitchBook MCP cover deals that haven't gone public yet?

Absolutely. The platform tracks private transactions using ``get_deals``, covering everything from early-stage VC investments to late-stage M&A agreements, even if they haven't hit the news wires.

05 What is the best way to research a founder's background?

Use ``get_professionals`` with their name and title. This provides a profile that often links them to companies, allowing you to then check those companies using ``get_company``.
