

MCP SERVER

NO CODE

CLOUD HOSTED

Recurly MCP

Manage Billing and Subscription Accounts Directly

Recurly MCP connects your AI agent directly to your subscription billing system. It lets you manage customer accounts, process invoices, adjust subscriptions, and look up payment history without ever leaving your chat interface. Treat your AI like a dedicated Revenue Operations assistant that handles the complex math of recurring revenue.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Recurly MCP

10 tools available

Cloud-hosted on Vinkius

You can give your conversational AI agent full control over your billing infrastructure. Instead of opening separate vendor consoles to check on payments or modify customer details, your agent performs those actions directly within the conversation flow. It reads payment records, checks current subscription status, and even helps you create a new account if needed.

Need to adjust a plan? You can easily read out all available catalog plans or update a client's active subscription state—like pausing it or reactivating it. If you need to verify payment success, the agent pulls up historical generated invoices immediately. This capability turns your AI into a powerful tool for Finance and Support teams alike.

Getting this connectivity is simple through Vinkius; once connected, your agent accesses all these billing functions at once. Whether you're pulling revenue analytics or just verifying if an invoice was paid last week, the data comes straight out to you.

Core Capabilities

01 — View and manage customer records

The AI can list every existing account in your system or pull detailed billing profiles for a specific client.

03 — Review payment history and invoices

The agent retrieves lists of generated invoices to confirm successful payments or check for missing records.

05 — Check current product offerings

The system lists all active catalog plans and available subscription models for review.

02 — Handle subscription lifecycles

You can read the current status of any subscription, enroll users on new plans, reactivate old ones, or permanently cancel services.

04 — Establish new customer accounts

It handles the creation of entirely new billing profiles, specifying the name, email, and account code up front.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/recurly — connect your AI agent in three steps.

- 01 Add the Recurly MCP to your authorized module list.
- 02 Configure the connection using your specific Recurly subdomain and Private API Key within Vinkius.
- 03 Talk naturally with your AI agent to process operations, like canceling a subscription or querying for an invoice.

The bottom line is that you get full billing control inside your chat interface without needing to switch tabs or log into separate dashboards.

Built For

This MCP is essential for anyone whose job involves understanding money movement: RevOps professionals who track recurring revenue, Customer Support Agents managing client accounts mid-chat, and Software Developers needing safe endpoints to test billing logic.

RevOps Manager

They use this MCP to pull detailed billing analytics, track active subscription statuses, or instantly generate plan insights during quarterly business reviews.

Customer Support Agent

The agent verifies if an account has a successful payment or needs a temporary pause/cancellation without needing to escalate the issue to billing engineering.

Software Developer

They interact safely with Recurly limits, list the ID structures of catalog plans, and test provisioning logic endpoints directly from their code editor.

What Changes When You Connect

- 01 No more context switching. You can check account details or list invoices right alongside your chat, skipping the need to open multiple tabs.

-
- 02** Handle billing changes instantly. Tools like `cancel_subscription` and `reactivate_subscription` let you adjust a client's status mid-conversation without human intervention.
-
- 03** Support staff gain immediate access to data. Instead of guessing if a payment went through, the agent uses `list_invoices` to confirm successful payments quickly.
-
- 04** Onboarding new clients is faster. You can use `create_account` and then immediately follow up with `create_subscription` —all in one chat session.
-
- 05** Always know what's available. By using `list_catalog_plans`, your agent keeps you updated on all current product offerings, so there's no guesswork.
-

Real-World Applications

Troubleshooting a missed payment

A customer complains about missing charges. The Support Agent asks the AI to execute `list_invoices` for that client. The agent quickly pulls up the invoice details, confirming it was paid last week and providing the transaction ID right in the chat.

Auditing subscription status

The Finance team needs a snapshot of all current recurring revenue streams. They ask the AI to run `list_subscriptions` across the entire base, getting an instant list that flags any expired or paused mandates.

Onboarding a new enterprise client

The RevOps Manager needs to set up a whole account. They first run `list_accounts` just to verify the company doesn't exist, then use `create_account`, and finally call `create_subscription` with the correct plan ID.

Restoring a lapsed service

A client accidentally canceled their account months ago. The agent uses `get_account_details` to confirm everything is fine and then runs `reactivate_subscription`, sending the confirmation directly to the user.

Patterns to Avoid

Over-relying on general knowledge

X AVOID

Asking the AI, 'What should I do with this customer?' and hoping it knows if they need a new billing profile or just a status check.

✓ INSTEAD

Be specific. Instead of that, use ``get_account_details`` first to confirm their existing setup. Then, if needed, follow up by calling ``create_subscription`` directly.

Forgetting the core billing data

X AVOID

Thinking an account is active when it's actually expired and needs manual intervention in a separate portal.

✓ INSTEAD

Always run ``list_subscriptions`` or ``get_subscription_details``. This MCP gives you the real-time status, so you don't rely on memory or outdated dashboards.

Trying to read product details manually

X AVOID

Having to check a separate documentation page just to see what plan codes are available for new clients.

✓ INSTEAD

Just ask the AI to run ``list_catalog_plans``. It pulls all active billing models into your chat instantly.

The Right Fit

Use this MCP if your workflow requires direct, actionable changes to customer accounts, subscriptions, or payments. If you need to check a user's current plan status, create an account, or confirm recent invoices, this is what you need. Don't use it just because you want general CRM data; for basic contact retrieval without billing context, another type of client tool might suffice. Crucially, if your task involves 'Did the payment clear?' or 'Can we change their plan?', then you absolutely need these tools like `list_invoices` and `create_subscription`. If you only need to read static marketing content or process non-billing workflows (like internal ticketing), this MCP won't help.

Checking on Billing Records Used To Be a Multi-Step Nightmare

Today, confirming if an invoice cleared usually means jumping between the CRM, the billing portal, and sometimes even a spreadsheet. You copy account IDs here, paste them there. If you need to check history, you click 'Invoices' on one tab, then open another tab for 'Accounts', and maybe a third just to verify the subscription status—all before you can answer the client.

With this MCP, all that complexity vanishes. You simply tell your agent what you need. It pulls up every piece of data, whether it's an invoice from last month or the current subscription state, and presents it cleanly in one conversation thread. The information is instant.

Recurly MCP: Instant Billing Control

You no longer have to manually navigate menus just to pause a client's service or reactivate an account after they paid. The agent handles the necessary commands, like running `cancel_subscription` or using `reactivate_subscription`, and confirms the change immediately.

The result is that your entire billing workflow moves from tedious clicking across three different systems into one seamless chat conversation. You're not just reading data; you're doing operational work.

Recurly MCP: 10 Tools for Billing Ops

These tools give you full operational control over billing records, allowing you to create, read, update, and delete nearly any resource in your Recurly ecosystem.

#	TOOL	DESCRIPTION
01	<code>cancel_subscription</code>	This tool permanently stops an active subscription's billing cycle.
02	<code>create_account</code>	It generates a brand new customer account using specified code, email, and name.
03	<code>create_subscription</code>	This tool sets up a new billing mandate for an existing or newly created account.
04	<code>get_account_details</code>	You retrieve all the core details and status information for one specific customer account.
05	<code>get_subscription_details</code>	It pulls up comprehensive data regarding a single, active subscription plan.
06	<code>list_accounts</code>	This function provides an overview of every customer account managed within Recurly.
07	<code>list_catalog_plans</code>	It lists all the available subscription plans that can be purchased through your product catalog.
08	<code>list_invoices</code>	This tool retrieves a list of historical invoices to verify payment status or amounts.
09	<code>list_subscriptions</code>	The AI lists all current and past subscriptions managed within the system.
10	<code>reactivate_subscription</code>	It restores a subscription that was previously canceled or allowed to expire.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U List the last 5 invoices generated in our account.

I executed `list_invoices` restricted to 5 items. The returned set includes invoice IN_UUID_1012 (\$59.00 - Paid) and IN_UUID_1013 (\$199.00 - Pending).

U Cancel the subscription with ID 'sub_39xjd82kw0'.

Running the `cancel_subscription` tool. The subscription 'sub_39xjd82kw0' has been set to cancel. It will not renew at the end of the current billing cycle.

U Retrieve the billing details for account code 'cus_alpha_92'.

I invoked `get_account_details` for 'cus_alpha_92'. The account corresponds to 'Alpha Corp'. It currently has an active subscription to the 'Enterprise Tier' and zero past due payments.

Frequently Asked Questions

01 How do I list all customer accounts using the Recurly MCP?

You use the `'list_accounts'` tool to get a comprehensive directory of every account in your system. This provides an immediate overview so you know exactly who is connected.

02 Can I check if a payment was successful with Recurly MCP?

Yes, run `'list_invoices'`. This tool retrieves all generated invoices, letting you confirm the status (Paid, Pending) and amount for any billing cycle.

03 What is the best way to update a client's plan using Recurly MCP?

You first need to use ``get_account_details`` to verify their current profile. Then, you can run ``create_subscription``, specifying the new plan ID and setting up the updated billing mandate.

04 Do I have to manually cancel a subscription after using Recurly MCP?

No. You simply ask your agent to execute ``cancel_subscription`` with the specific subscription ID, and it handles the irreversible change for you.

05 Can I use Recurly MCP to find out what plans are available?

Yes, running ``list_catalog_plans`` pulls every active billing model from your product catalog. This is useful if you need to suggest a new plan to a client.
