MCP SERVER | NO CODE | CLOUD HOSTED

SEC EDGAR MCP

Turn complex SEC documents into simple answers.

SEC EDGAR provides direct, programmatic access to the official US corporate filings database. Your AI client uses this MCP to retrieve required documents like 10-K and 10-Q reports, extract specific structured financial data (XBRL), and look up core company disclosures for any public entity using its Central Index Key. It turns massive government databases into natural conversation topics.

A+ Quality Score 100/100

SCAN TO VIEW

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

> *The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.*
>
> — Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256	Ed25519	24h TTL	V8 Isolate
Encryption at rest	PKI vault signatures	Ephemeral session keys	Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

06 — Honeytoken Trap System

Phantom credentials are injected into isolated environments. If a honeytoken is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1) Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

SEC EDGAR MCP

3 tools available
Cloud-hosted on Vinkius

Your AI agent can act as a dedicated financial analyst without you having to navigate the Securities and Exchange Commission's complex website. This MCP connects your client directly to primary source corporate intelligence, letting you ask specific questions about public companies. Need to know the net income for Microsoft over the last three years? Just ask. You don't have to download PDFs or manually parse XBRL tags; your agent handles that deep data extraction automatically. You can track a company's recent regulatory activity by pulling every filing they submitted, or you can check historical records to find how a specific financial concept was treated across multiple fiscal periods for the same entity. It makes auditing and fundamental research simple. By connecting this MCP through Vinkius, your agent gains specialized expertise that goes far beyond general web search capabilities.

Core Capabilities

01 — Track regulatory activity

Retrieve a company's most recent official submissions (like 10-Q and 8-K forms) using its Central Index Key.

02 — Extract structured financial numbers

Pull specific, quantifiable financial data points—such as balance sheet totals or income statement figures—from the official XBRL filings.

03 — Look up core financial concepts

Fetch how a company disclosed and reported on specific financial topics across various years in their public records.

One Click on Vinkius — From Prompt to Execution

Available at **vinkius.com/mcp/sec-edgar** — connect your AI agent in three steps.

01 First, connect your preferred AI client to this MCP catalog listing.

02 Second, specify the company's Central Index Key (CIK) and what information you need from their filings.

03 Finally, your agent runs the query, retrieving structured data points or lists of documents directly into the chat interface.

The bottom line is that you get immediate, actionable financial intelligence without ever touching a web browser or API key.

Built For

Financial Analysts and Compliance Officers need this. They spend hours digging through massive, unstructured corporate reports just to find one number. This MCP lets them get straight answers about financial standing and regulatory adherence.

Financial Analyst

You use it to quickly gather historical data for valuation models or compare key metrics across competing industry players.

Compliance Officer

You verify that a public entity's disclosures adhere to specific regulatory standards by cross-referencing multiple years of filings.

Investment Researcher

You monitor recent submissions and quarterly reports for portfolio companies, catching major corporate events the moment they are filed.

What Changes When You Connect

01 Instead of downloading and opening dozens of PDFs, your agent summarizes the most recent filings for a company using `get_submissions`, giving you an immediate overview of their regulatory status.

02 You don't need to manually parse XBRL tags. The `get_company_facts` tool pulls specific financial figures—like net income or revenue—into clean, structured data points ready for analysis.

03 Need a longitudinal view? Use the `get_company_concept` function to track how a company defined and reported on a single concept across five different years' filings.

04 The entire process is controlled by your natural conversation. You just ask: 'What were their Q3 liabilities?' and get an answer, not a dataset of links.

05 It removes the friction between raw data and insight. Your agent acts like a specialized analyst who reads all the fine print for you.

Real-World Applications

Comparing industry peers on debt levels

A financial analyst needs to compare the long-term liabilities of three major competitors. Instead of visiting three separate SEC pages, they ask their agent to use `get_company_concept` for 'Liabilities' across all three CIKs. The AI compiles a single comparison table immediately.

Tracking sudden corporate changes

A compliance officer suspects a company filed something major but missed the memo. They use `get_submissions` to pull every filing type for the last 60 days, allowing them to quickly spot an unusual or critical report.

Building a multi-year trend model

An academic researcher wants to analyze how 'Research & Development' spending changed over the last decade. They prompt their agent with `get_company_facts` for that specific concept across multiple years, building a historical data set in minutes.

Due diligence on an acquisition target

An investment team needs to know the exact reported net income loss from a company's official filings. They ask their agent to use `get_company_facts` for 'NetIncomeLoss,' getting accurate, verified numbers directly from the source.

Patterns to Avoid

Treating it like a general search engine

✗ AVOID

Asking your agent, 'Tell me about Apple's finances.' The system will give you Wikipedia fluff, not verifiable numbers.

✓ INSTEAD

You must be specific. Ask the agent to use `get_company_facts` for 'Total Revenue' and provide the CIK number. This forces the tool to query structured financial data.

Ignoring required identifiers

✗ AVOID

Simply saying, 'Show me Apple's reports.' The system doesn't know which entity you mean.

✓ INSTEAD

Always provide the Central Index Key (CIK) for precision. Use `get_submissions` with the CIK to ensure you are pulling data only for the correct legal entity.

Over-relying on PDF reports

✗ AVOID

Manually opening a 10-Q and hunting through tables to find a specific metric.

✓ INSTEAD

Use `get_company_concept` or `get_company_facts`. These tools bypass the need for manual document reading and pull only the data points you specify.

The Right Fit

Use this MCP if your task requires verifiable, structured financial reporting from public companies. Specifically, if you need to compare metrics (like Assets) across different time periods or legal entities, this is essential. Don't use it if you just want general news about a company; that's for standard web search tools. Furthermore, don't use it to analyze internal corporate documents or private information, as the scope is strictly limited to SEC public filings. If your goal involves synthesizing complex narratives or writing a full report based on these numbers, then connecting this MCP into a larger agent workflow (like those built in LangChain or CrewAI) will maximize its value.

Digging through corporate history is a nightmare of PDFs and acronyms.

Today, finding specific financial data means navigating the SEC website. You find the company's CIK, then you search for the filing year, download the 10-Q or 10-K PDF, and then you open up a spreadsheet program to hunt down the exact line item—like 'Net Income Loss'—from among hundreds of pages of dense text.

With this MCP, that entire manual process vanishes. You simply tell your agent what financial fact you need from a specific public company, and it gets the clean number without you ever seeing an ugly PDF or having to worry about XBRL tags.

SEC EDGAR: Structured Data on Demand

Manual steps that disappear include navigating through multiple filing types, opening and reading dozens of reports just for context, and spending hours transcribing key figures into a database.

The difference now is immediate access to truth. You're not summarizing what the company *said*; you're getting the structured data points pulled directly from the official record.

SEC EDGAR: 3 Tools for Financial Analysis

These tools allow you to retrieve company submission histories, pull specific structured financial metrics, and look up core financial concepts directly from the SEC database.

#	TOOL	DESCRIPTION
01	`get_company_concept`	Retrieves a company's disclosed financial data for a specific concept (e.g., 'Assets' or 'Liabilities').
02	`get_company_facts`	Pulls structured financial facts, like income statement figures, from official filings.
03	`get_submissions`	Lists all recent regulatory filings for a company using its Central Index Key (CIK).

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Get recent submissions for Apple Inc (CIK 0000320193).

Retrieving recent filings for Apple... I found the latest submissions including their most recent 10-Q and several 8-K reports. Would you like to see the details of a specific form?

U Extract the 'NetIncomeLoss' for Microsoft (CIK 0000789019) for the last 3 years.

Fetching financial facts for Microsoft... I've retrieved the Net Income figures from their official XBRL filings for the last 3 fiscal years. Microsoft reported $72.3B in 2023, $61.2B in 2022, and $61.3B in 2021.

U Find all filings for Tesla (CIK 0001318605) related to '8-K' forms this year.

Filtering Tesla submissions... I've identified 5 '8-K' (current report) filings for Tesla so far this year. These usually cover major corporate events. Would you like to see the items disclosed in the most recent one?

Frequently Asked Questions

01 **How do I use SEC EDGAR with a CIK?**

You must provide the Central Index Key (CIK) for precision. Use it when calling `get_company_submissions` or any other function to ensure your agent targets the correct legal entity.

02 **Can SEC EDGAR pull data from non-US companies?**

No, this MCP is limited to official filings within the US Securities and Exchange Commission database. It only covers public entities filed in the U.S.

03 **Is the financial data provided by get_company_facts real time?**

The data reflects the most recently submitted, publicly available filings. Since this is based on government records, there's a slight delay between filing and availability here.

04 **What if I need to compare concepts over many years using get_company_concept?**

You can ask your agent to fetch the same financial concept for multiple fiscal periods. This is ideal for trend analysis that would otherwise require tedious manual data compilation.

05 **Do I need an API key for SEC EDGAR MCP access?**

No, this integration uses public access methods (User-Agent) and doesn't require you to manage or provide a traditional API key within your AI client setup.
