

MCP SERVER

NO CODE

CLOUD HOSTED

Teambition MCP

Manage projects and tasks with conversation.

Teambition MCP connects your AI agent directly into Alibaba's Teambition project management platform. Instead of navigating complex dashboards or clicking through multiple screens, you simply ask your agent to perform actions like listing projects, creating new tasks, or updating team member statuses using natural conversation. It turns large-scale corporate workflow tracking into a simple dialogue.

enterprise-software

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Teambition MCP

10 tools available

Cloud-hosted on Vinkius

Managing an entire team's workload usually means jumping between tabs and copy-pasting data—a painful, click-heavy process. This MCP changes that entirely. By connecting Teambition to your agent, you can handle complex project workflows by simply talking to it. Your agent acts like a real-time project assistant. You ask it to list all active projects or find out who's assigned to 'Q3 Marketing Plan,' and it gives you the answer instantly. It doesn't just read data; it lets you perform actions. Need to update a task status because a developer finished their part? Just tell your agent, and it handles the record change in Teambition. This level of project control is what makes Vinkius such a critical resource for keeping enterprise tools accessible through conversation.

Core Capabilities

01 — Map Project Status

Retrieve detailed information on projects, monitor their overall progress, and list all associated stages.

02 — Manage Tasks

Create new tasks for specific projects or update existing task details like status, assignee, and due date.

03 — Identify Team Members

List all project members, organization users, and retrieve high-level structural information about your company's Teambition setup.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/teambition — connect your AI agent in three steps.

- 01 Subscribe to this MCP using your desired AI client.
- 02 Enter your specific Teambition App ID and App Secret credentials into the Vinkius catalog.
- 03 Ask your agent a task, like 'List all projects for the Website Redesign,' and it performs the action in real time.

The bottom line is you talk to your agent instead of clicking through dashboards.

Built For

Project Managers, Operations Analysts, and Development Leads. If you spend more time coordinating status updates than actually doing work, this MCP cuts out the friction.

Project Manager

Needs to audit task statuses across multiple projects quickly and assign follow-ups without leaving their chat interface.

Operations Analyst

Oversees the entire organizational structure, retrieving high-level insights on team capacity and project alignment for leadership reviews.

Software Developer Lead

Manages sprint backlogs by creating new tasks or updating progress statuses immediately after a code review session.

What Changes When You Connect

- 01 Stop manually checking project statuses. Ask your agent to list all accessible projects, getting an instant summary of what's active without opening the web interface.

-
- 02** Task management gets fast. Instead of navigating deep into workflows, simply tell your agent to create a new task and specify its title, assignee, and due date.
-
- 03** Team coordination becomes simple. You can ask the MCP to list project members or organization users, giving you immediate access to who is available for assignments.
-
- 04** Workflow visualization is instant. Need to know what stages a project uses? Your agent lists all task groups and shows every stage inside them.
-
- 05** Updates happen in seconds. Use the tool to update an existing task's status directly from your chat, logging the change without any clicks.
-
- 06** Organization context is clear. Get high-level info about the entire organization structure or retrieve detailed data on a single project at a glance.
-

Real-World Applications

The Status Check Nightmare

A Project Manager needs to know if three different teams are ready for a product launch, but the status lives in three separate projects. They ask their agent to list all accessible projects and then list tasks for each one. The agent aggregates this data immediately, providing a single, consolidated report on task completion across all sites.

Sprinting Quick Fix

A Developer Lead finishes a module for an internal audit. Instead of logging into Teambition, they tell their agent: 'Update the status of task X to Complete and assign it to QA.' The MCP handles the update_task action instantly.

Offboarding Assignments

An Operations Analyst realizes a key user left the company. They use the MCP to list organization users and then cross-reference that against project members to immediately identify every team member who needs their assignments reallocated or documented.

New Initiative Kickoff

A team needs a new workflow tracked. They ask their agent to get detailed info on 'New Feature Project,' which shows the existing project structure, allowing them to then use the MCP to create necessary sub-tasks and group them correctly.

Patterns to Avoid

Manual Status Syncing

X AVOID

Copying status reports from Teambition into Jira or Notion every Friday because no one has time to update the source platform.

✓ INSTEAD

Use the MCP's capabilities to list tasks and get project details. Your agent pulls the data directly, giving you a consistent view without manual copy-pasting.

Guessing Permissions

X AVOID

Trying to create a task but getting an error because you didn't know which specific App ID or scope was required for that action.

✓ INSTEAD

Ensure your credentials are correctly entered in the Vinkius catalog. The MCP handles authentication and only executes actions with the permissions you grant it.

Over-relying on Dashboards

X AVOID

Spending 15 minutes filtering filters, changing views, and trying to find one specific user's role within a massive organizational chart.

✓ INSTEAD

Directly ask the agent to list project members or list users. It bypasses the visual clutter and pulls only the structured data you need.

The Right Fit

Use this MCP if your primary pain point is coordinating complex, multi-stage workflows that require frequent status changes—think software development sprints, marketing campaign rollouts, or large departmental audits. You need to move beyond reading reports and actually *change* the data (create tasks, update statuses) through conversation.

Don't use this if you just need a simple calendar view of deadlines. For pure viewing, an external dashboard might be fine. But if your goal is to actively manage records, track progress, or pull structural data on who reports to whom, this MCP is necessary. It excels at the 'read and write' cycle inherent in project management.

The Manual Pain of Project Status Tracking

Today, tracking a single cross-department initiative means opening Teambition, navigating to the main dashboard. You then have to click into the 'Marketing' project, check the task groups, find the relevant stage, and maybe open another tab to see who is assigned to it. If you need six different statuses, that's six different journeys through clicking links and scrolling fields.

With this MCP, you just talk to your agent. You tell it exactly what you need—'What are the next steps for the Q2 plan?' The agent handles all those clicks internally, pulling together task groups, stages, and member assignments into one simple reply.

Teambition MCP: Direct Task Control

The manual steps that vanish are the status update cycle and data aggregation. You no longer have to log in, find the correct task ID, change its status dropdown from 'In Progress' to 'Review,' and then manually notify the next person. All of this happens via a single conversation command.

What's different now is that your agent doesn't just read data; it executes commands. You gain true conversational control over the core project workflow.

Teambition: 10 Tools for Project Management

These tools let your agent read organizational data, build new records, update status fields, and map out entire project structures within Teambition.

#	TOOL	DESCRIPTION
01	<code>create_task</code>	Creates an entirely new task record within Teambition for a specific project.
02	<code>get_org_info</code>	Fetches high-level information and details about the overall organization structure in Teambition.
03	<code>get_project</code>	Retrieves specific, detailed data for a single named project within Teambition.
04	<code>list_members</code>	Generates a list of all users who are currently members of a specified project.
05	<code>list_projects</code>	Retrieves a comprehensive list of every accessible project managed by the organization.
06	<code>list_stages</code>	Lists all distinct stages or workflow steps within a defined task group.
07	<code>list_task_groups</code>	Shows the major grouping containers used for organizing tasks inside a project.
08	<code>list_tasks</code>	Retrieves a list of specific tasks, along with their current status and assignee, within a given project.
09	<code>list_users</code>	Lists all available individual users registered within the Teambition organization.
10	<code>update_task</code>	Modifies an existing task's attributes, such as changing its status or updating the responsible party.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U List all my active projects on Teambition.

I've retrieved your Teambition projects. You have 4 active projects, including 'Website Redesign' and 'Q2 Marketing Plan'. Which one would you like to explore?

U Create a task in project 'Product Launch' titled 'Review landing page copy'.

Done! I've created the task 'Review landing page copy' in the 'Product Launch' project. Would you like to assign it to someone or set a due date?

U Show me the tasks for project 'Internal Audit'.

I've listed the tasks for 'Internal Audit'. There are 8 pending tasks, including 'Inventory check' and 'Compliance review'. Should I filter them by status or assignee?

Frequently Asked Questions

01 How do I use Teambition MCP to get a list of all my projects?

You simply prompt your agent with an instruction like 'List all accessible projects.' The MCP uses the `list_projects` tool to fetch every project name and ID, giving you a full overview immediately.

02 Can I use Teambition MCP to change a task's status?

Yes. You tell your agent which task needs updating (using `update_task`), specify the new status, and it handles modifying the record in Teambition for you.

03 Does Teambition MCP only show me tasks assigned to me?

No. You can ask the agent to list tasks within an entire project (`list_tasks`), allowing you to see everything, regardless of who the assignee is.

04 What if I need information about people on a project?

You use the `list_members` tool. Just name the project and ask for the members, and your agent retrieves the full roster assigned to that specific workflow.
