

MCP SERVER

NO CODE

CLOUD HOSTED

ThriveCart MCP

Audit Sales, Products & Subscriptions Instantly

ThriveCart MCP connects your AI client directly to your e-commerce sales data, letting you audit transactions and manage products without logging into a dashboard. Quickly list customers, check subscription statuses, or retrieve detailed transaction metadata—all through natural conversation.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

ThriveCart MCP

10 tools available

Cloud-hosted on Vinkius

This MCP hands your AI agent direct access to every part of your checkout process. You stop dealing with complex dashboards and start talking sales data to your agent. Whether you sell physical goods, courses, or recurring subscriptions, your agent acts as a real-time back office expert. It can instantly list all your products for inventory checks, pull up the history for any customer, or audit specific transactions. Need to know if a coupon was applied correctly? Ask. Want to see who renewed their subscription today? Just ask. By connecting ThriveCart via Vinkius, you turn complicated sales management into simple conversation. Your agent handles all the querying and data retrieval so your revenue information is always organized and ready when you need it.

Core Capabilities

01 — Audit Sales History

The agent pulls up a detailed list of recent or historical transactions, providing full metadata for every sale.

03 — Check Subscription Statuses

The MCP queries whether a subscription is active or cancelled and pulls specific customer billing records.

05 — Retrieve Specific Sales Data

The agent fetches granular details for any single transaction, product, or customer ID you provide.

02 — Manage Product Catalog Details

You can retrieve the current details on all your listed products, upsells, and coupons in one go.

04 — View Customer Records

You can list existing customers and view their complete purchase history to calculate lifetime value.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/thrivecart — connect your AI agent in three steps.

- 01 Subscribe to this MCP and enter your ThriveCart API key.
- 02 Connect the MCP to your preferred AI client (like Claude or Cursor).
- 03 Ask your agent a natural language question, like 'What were my sales yesterday?' The tool executes the query and gives you the structured data.

The bottom line is that instead of logging into multiple dashboards to pull data, you talk to your AI client, and it pulls the exact information directly from ThriveCart for you.

Built For

E-commerce owners who are tired of juggling 10 tabs just to check yesterday's sales figures. Marketing leads needing instant verification on coupon usage, and support staff who waste minutes navigating dashboards to confirm a customer's subscription status.

Operations Manager

Automating the routine querying of sales data, ensuring all e-commerce growth metrics are accessible without manual effort.

Customer Support Specialist

Performing rapid transaction audits and verifying subscription statuses for customers immediately during a chat session.

E-commerce Owner

Monitoring daily sales totals and product details straight from their workflow, getting real-time financial oversight.

What Changes When You Connect

- 01 Stop guessing on revenue. By calling `list_transactions` or `getting_transaction` details, you get a clean audit trail of sales activity, including metadata for every purchase.

-
- 02 Keep your product catalog current. Use `list_products` to verify all products and upsells are correctly set up, eliminating the need to click through multiple admin tabs.

 - 03 Handle customer billing issues faster. With `get_subscription`, you can immediately check a client's status or find specific payment details without asking them for screenshots.

 - 04 Boost support speed. If a user asks about an old purchase, calling `list_customers` followed by `get_transaction` gives the agent all the necessary context in seconds.

 - 05 Maintain data integrity. The ability to call `list_coupons` lets your team quickly verify if discounts are applying correctly before confirming a sale.
-

Real-World Applications

Checking for abandoned sales details

A customer support agent needs to know why a user couldn't complete their order. The agent uses `list_customers` and then `get_transaction` on the customer ID, quickly identifying if the sale failed due to an expired coupon or payment error.

Onboarding new staff quickly

A manager needs a quick overview of all services offered. They ask their agent to `list_products` and `list_upsells`, getting immediate confirmation that every service tier is accounted for in the catalog.

Reviewing monthly revenue dips

The e-commerce owner notices a drop in sales. They ask their agent to `list_transactions` for the last seven days. The tool reveals that upsells stopped running on Tuesday, pointing directly to where the problem started.

Verifying billing discrepancies

Support team receives a complaint about an incorrect renewal charge. The agent uses `get_subscription` with the customer's email to pull up the exact plan details and billing cycle date, solving the issue instantly.

Patterns to Avoid

Searching for data in plain text

X AVOID

Writing 'What sales do I have?' only gets a vague summary. It doesn't tell you if specific coupons were used or why revenue dropped on Tuesday.

✓ INSTEAD

Be precise: 'List the transactions from last month and include details about any applied coupon.' This triggers `list_transactions` and gives actionable metadata.

Forgetting to specify a customer ID

X AVOID

Asking for 'details on that subscription' is useless. The agent can't guess which client you mean, resulting in an error or general data dump.

✓ INSTEAD

Always include the identifier: 'Get details for the subscription belonging to john@doe.com.' This triggers `get_subscription` correctly.

Assuming product availability

X AVOID

Just asking 'What products are available?' might only list active items, missing crucial historical data about retired or updated upsells.

✓ INSTEAD

To see the full picture, ask to `list_products` and also use `list_upsells` so you cover both current offerings and potential add-ons.

The Right Fit

Use this MCP if your core need is real-time access to sales, subscription, and customer data from ThriveCart. Specifically, it's perfect for auditing transactions (`list_transactions`) or checking account status (`get_subscription`). Don't use this if you are trying to manage fulfillment logistics—for example, confirming stock levels on a warehouse floor. For inventory checks, you need a dedicated inventory system MCP instead. If your goal is only updating the *content* of your website, an asset management tool is better. But if it involves money, customers, or subscriptions, this MCP is what you need.

The Sales Dashboard Clutter

Today, checking your e-commerce health means logging into ThriveCart's dashboard and navigating through tabs for transactions, products, and customer records. You copy a date range from one view, paste it into a spreadsheet, then switch to the subscription tab to verify if billing details match up—it takes ten clicks and half an hour of context switching.

With this MCP, you simply ask your agent, 'Show me all transactions that failed payment last week.' The tool handles the data retrieval across multiple internal records and hands you a single, clean summary. You get instant answers without ever touching a dashboard.

Get Instant Sales Audits with ThriveCart MCP

The manual process of verifying a sale involves locating the customer record (`list_customers`), then finding the specific purchase transaction (`get_transaction`) to see if all items and coupons were applied correctly. If you need billing details, you have to navigate away from the sales view entirely.

Now, your agent pulls together that entire picture—customer data, sale records, and subscription status—in a single query. You get one continuous narrative of what happened with the money, making audits painless.

ThriveCart: 10 Tools for E-commerce Auditing

Use these tools to manage everything from listing all customers to auditing the specific metadata of any single sale or subscription.

#	TOOL	DESCRIPTION
01	<code>get_customer</code>	Pulls all specific identifying information for a single customer account.
02	<code>get_product</code>	Retrieves detailed specifications and pricing data for one particular product.
03	<code>get_subscription</code>	Gathers all details related to a specific customer's recurring subscription plan.
04	<code>get_transaction</code>	Pulls the full record and metadata for any single recorded sale or transaction.
05	<code>list_coupons</code>	Retrieves a list of all currently active and inactive discount coupons.
06	<code>list_customers</code>	Generates an accessible list of every customer registered in your ThriveCart account.
07	<code>list_products</code>	Provides a comprehensive catalog listing of all products, upsells, and coupons available for sale.
08	<code>list_subscriptions</code>	Generates an accessible list of every active and cancelled subscription record.
09	<code>list_transactions</code>	Pulls a summarized, recent list of all sales activities that happened in your store.
10	<code>list_upsells</code>	Lists out all the one-time upsell offers you have created for customers.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U List my top 5 recent transactions in ThriveCart.

I've retrieved your recent sales. You have 5 new transactions, including a \$97 purchase for 'Masterclass AI' by john@doe.com. Would you like the full details for any of them?

U Show me all my active products.

I've found 3 active products in your account: 'Course X', 'Ebook Y', and 'Consulting Z'. I can provide pricing and upsell info for each if you like.

U Check if there are any new subscriptions today.

I've scanned your subscriptions. You have 2 new recurring agreements started today for 'VIP Program'. Both are currently in active status.

Frequently Asked Questions

01 Does ThriveCart MCP track refunds?

Yes, it tracks transaction details, which includes refund data. By calling `get_transaction`, you can retrieve full metadata for any specific sale and see if a refund was processed.

02 Can I list all my products and their upsell options with ThriveCart MCP?

Absolutely. You use the `list_products` tool to get your main catalog, and then call `list_upsells` to pull up every available add-on offer in one go.

03 How do I check if a customer is still paying for their subscription using ThriveCart MCP?

Use the `get_subscription` tool. This pulls all current payment and status details, letting you confirm if the agreement is active or when it expires.

04 Is this useful for tracking coupon usage in ThriveCart?

Yes. You can use `list_coupons` to see all available codes, and then audit transactions using `get_transaction` to verify which coupons were successfully applied on any given sale.
