

MCP SERVER

NO CODE

CLOUD HOSTED

Tianyancha / 天眼查 MCP

Audit Ownership and Monitor Corporate Risks Instantly

Tianyancha / 天眼查 is China's premier enterprise data platform, giving your AI agent deep business intelligence capabilities. It allows you to instantly search for any company, audit its ownership structure, and monitor operational risks from a natural language prompt. Instead of navigating complex web portals, your agent retrieves detailed corporate metadata, including staff lists, registered patents, court cases, and shareholder relationships, turning due diligence into a conversation.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Tianyancha / 天眼查 MCP

10 tools available

Cloud-hosted on Vinkius

Tianyancha connects deep business intelligence straight to your workflow. It lets your AI agent take over the tedious work of researching companies—the kind of multi-step investigation usually requiring multiple tabs and hours of clicking. When you connect this MCP via Vinkius, your agent becomes a real-time corporate auditor. You don't need to manually navigate Tianyancha's massive portal; your AI client handles it all.

Need to audit a potential partner? Ask your agent to list the company's shareholders and check for any legal risk indicators instantly. Want to know who runs the place? It can retrieve main staff and executive lists. Need to vet intellectual assets? Your agent finds registered trademarks, patents, and copyrights. This means you move from complex data gathering to decision-making, keeping your B2B research accurate and fast.

Core Capabilities

01 — Search for Companies

Find specific businesses using keywords across China's corporate registry.

03 — Assess Corporate Risk

Pull risk indicators, court cases, and industrial abnormalities for due diligence checks.

05 — Review Corporate Assets

Audit a company's intellectual property portfolio, including registered trademarks and patents.

02 — Audit Ownership Structures

Map out a company's ownership by listing primary shareholders and their outward investments.

04 — Track Personnel

Identify key decision-makers by listing the enterprise's main staff and executives.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/tianyancha — connect your AI agent in three steps.

- 01 Subscribe to this MCP on Vinkius and provide your Tianyancha API Token.
- 02 Connect your AI client (Claude, Cursor, Windsurf, etc.) to the configured MCP endpoint.
- 03 Ask your agent a question using natural language; it will execute the necessary calls to gather and summarize the required corporate data.

The bottom line is that you talk to your AI client like talking to a research assistant who already has access to all this company data.

Built For

This MCP is for professionals whose job depends on vetting companies before making a move. Think legal counsel doing due diligence, B2B sales reps needing instant lead verification, or business analysts researching market competition.

Legal Counsel

Runs pre-acquisition checks by listing shareholders and retrieving risk indicators to spot potential liabilities.

B2B Sales Development Rep (SDR)

Verifies a prospect's legitimacy and identifies key executives using the list_staff tool, speeding up outreach efforts.

Business Analyst

Gathers comprehensive data on market competitors, pulling basic info and tracking registered intellectual property for competitive reports.

What Changes When You Connect

- 01 Instant Risk Spotting: Instead of reading through endless court filings, you ask your agent to run 'list_risks' on a target company. It aggregates all potential issues—from legal cases to industrial abnormalities—into one summarized report.

-
- 02 Deep Ownership Mapping: Quickly determine who owns what with the 'list_shareholders' tool. You can trace complex corporate structures and see exactly where a company has made its outward investments using 'list_investments'.

 - 03 Executive Identification: Stop guessing who the decision-maker is. Use 'list_staff' to get a clean list of main staff and executives, allowing your agent to target communications accurately.

 - 04 Comprehensive Vetting: Get both basic details ('get_basic_info') and full records ('get_full_details'), ensuring you have every piece of data needed for thorough due diligence before signing any contract.

 - 05 IP Asset Audit: Check a company's intellectual standing by running 'list_ip'. This tool quickly pulls up registered trademarks, patents, and copyrights, giving you immediate insight into their core assets.
-

Real-World Applications

Vetting a Potential Merger Partner

A M&A lawyer needs to know if the target company has any hidden liabilities. They ask their agent to run 'list_risks' and then cross-reference that data with 'get_full_details' to see if the risk factors are tied to specific operational branches, saving days of manual database work.

Competitive Market Research

A business analyst wants a full profile on five market leaders. They use their agent to run 'search_enterprise' first, then call 'list_ip' and 'get_basic_info' for each result sequentially, building a complete competitive matrix in minutes.

Identifying Corporate Control

A competitor needs to know who controls a rival firm. They use their agent to run 'list_shareholders' and then follow up with 'get_contact_info' for the largest listed owner, immediately identifying key points of contact.

Due Diligence for Investment Capital

An investment team needs to understand the full scope of an emerging tech company. They ask their agent to retrieve 'list_investments' and 'list_branches', confirming both where the money is going and where the physical operations are located.

Patterns to Avoid

Checking only public websites

X AVOID

Trying to find a company's full ownership structure by just looking at their official corporate website, which usually only shows basic contact info.

✓ INSTEAD

Use the MCP's 'list_shareholders' tool. It accesses deep registry data, giving you visibility into out-of-scope owners and complex legal relationships that aren't public.

Manually checking risk reports

X AVOID

Copying and pasting information from multiple government or court databases to build a single risk profile for due diligence.

✓ INSTEAD

Run 'list_risks'. This tool aggregates numerous sources—court cases, abnormalities, etc.—and presents them in one coherent data set for immediate review.

Assuming basic info is enough

X AVOID

Stopping after retrieving basic details ('get_basic_info') and missing crucial operational context like registered patents or key staff.

✓ INSTEAD

Always follow up by running 'list_ip' to audit assets, and use 'list_staff' to identify the actual people who run the business.

The Right Fit

Use this MCP if your work requires deep corporate verification, risk assessment, or ownership auditing. If you need to know *who* owns a company, *what* assets it holds, or *if* it has legal exposure, this is the right tool. Don't use this if all you need is simple directional information (like finding a single phone number). For simple lookups, 'get_contact_info' works fine. But for anything that requires understanding relationships—ownership via 'list_shareholders', or liabilities via 'list_risks'—you need the full power of Tianyancha.

Gathering Corporate Data Used to Take Days

Today, vetting a company is a bureaucratic nightmare. You start by finding basic details on one portal, then you open another to check their legal history, and yet another for IP assets. This means logging into five different websites, cross-referencing dates, and manually copying data into a spreadsheet just to build a preliminary risk profile.

With this MCP, your agent handles the heavy lifting. You simply tell it what you need—say, 'Check all risks and ownership.' The system runs multiple tools ('list_shareholders', 'list_risks') in sequence and gives you one unified report. You don't gather data; you get answers.

Tianyancha / 天眼查 Gives You a Complete, Interconnected View

The major manual steps that vanish are the individual searches for branches or staff. Instead of running 'list_branches' and then opening a separate sheet to list all registered executives via 'list_staff', your agent connects these two datasets automatically.

This means you stop piecing together data points and start building narratives. You get a cohesive intelligence briefing that lets you know exactly who is responsible for the company, where its money is going, and if it's legally safe to deal with.

Tianyancha / 天眼查 with 10 Tools

These ten tools let your AI agent execute deep searches across the corporate registry, allowing you to list assets, check risks, and map out ownership structures.

#	TOOL	DESCRIPTION
01	<code>get_contact_info</code>	Retrieves the core contact details for a specific enterprise.
02	<code>get_full_details</code>	Pulls all available basic and industrial metadata about a company.
03	<code>list_branches</code>	Lists the full network of registered business branches for an enterprise.
04	<code>list_investments</code>	Provides a record of all outward investments made by the company.
05	<code>list_ip</code>	Lists registered intellectual property assets, including trademarks and patents.
06	<code>list_risks</code>	Retrieves detailed risk information, court cases, and industrial abnormalities for a company.
07	<code>list_shareholders</code>	Lists the owners of the company, detailing corporate ownership structure.
08	<code>list_staff</code>	Identifies and lists key decision-makers by providing main staff and executive names.
09	<code>search_enterprise</code>	Initiates a search for companies based on keywords or industry names.
10	<code>get_basic_info</code>	Gathers the essential, high-level basic information about an enterprise.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Search for companies named 'Alibaba' in Tianyancha.

I've retrieved the search results for 'Alibaba'. There are several matches, including 'Alibaba Group Holding Limited' and 'Alibaba Cloud'. Which one would you like the basic information for?

U Show me the shareholder structure for 'Huawei'.

I've listed the shareholders for Huawei. The primary owner is the Union of Huawei Investment & Holding Co., Ltd. Would you like a list of Huawei's outward investments as well?

U Check for any risk information regarding 'Evergrande'.

I've retrieved the risk indicators for Evergrande. There are numerous court cases and industrial abnormalities listed. Should I retrieve the details for the most recent legal incidents?

Frequently Asked Questions

01 How do I use Tianyancha / 天眼查 MCP to check ownership?

Use the 'list_shareholders' tool. You simply ask your agent for the shareholder structure of a company, and it retrieves the primary owners and their detailed stake in the business.

02 Can Tianyancha / 天眼查 MCP find patents?

Yes, use 'list_ip'. This tool pulls up all registered intellectual property for an enterprise, including both trademarks and patents. It's great for competitive analysis.

03 What if I only want to know the risks? Should I use Tianyancha / 天眼查 MCP?

Absolutely. The 'list_risks' tool aggregates court cases, industrial abnormalities, and other risk indicators into one place, saving you from checking multiple legal databases.

04 Does the MCP handle branch locations?

Yes, run the 'list_branches' tool. It provides a comprehensive list of all registered physical branches across China for any given company.

05 How do I get basic info and staff lists at once using Tianyancha / 天眼查 MCP?

Ask your agent to perform both 'get_basic_info' and 'list_staff'. You can then ask the agent to synthesize that data, giving you a profile of the company alongside its key decision-makers.
