

MCP SERVER

NO CODE

CLOUD HOSTED

Tome (AI Storytelling) MCP

Build Presentations Conversationally, Page by Page

Tome (AI Storytelling) lets your agent build and manage entire presentations using natural conversation. Connect it to generate storyboards, create new project decks in specific workspaces, and add pages to existing narratives without ever opening the web app. It makes AI-driven content creation conversational and hands-free.

A+ Quality Score 100/100

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeytoken Trap System

Phantom credentials are injected into isolated environments. If a honeytoken is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Tome (AI Storytelling) MCP

5 tools available

Cloud-hosted on Vinkius

Stop clicking through slide templates and manually assembling projects. This MCP connects your preferred AI client directly into Tome, turning storyboarding from a multi-tab ordeal into a simple conversation with your agent. Your AI acts as the creative director, handling all the background work. Need to start fresh? The agent can list available workspaces so you know exactly where your content lives. Want to build out an existing project? You can ask your agent to create a brand new tome in a specific spot or add detailed pages directly into a narrative structure. This capability means you manage complex storytelling projects entirely from your chat window, using Vinkius as the gateway to the full catalog of services.

Core Capabilities

01 — List available workspaces

Retrieves all connected Tome workspaces so you know where to start building content.

02 — Create new presentation projects (tomes)

Builds a brand new story or presentation deck within a specific workspace.

03 — Get details on a tome

Fetches the full structure and metadata for an existing project, letting you see what's already in place.

04 — List all tomes in one workspace

Provides an overview of every presentation deck currently stored within a selected workspace.

05 — Add pages to existing stories

Expands your narrative by adding new, specific pages to any active tome structure.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/tome-ai-storytelling — connect your AI agent in three steps.

- 01 Subscribe to this MCP and provide the required Tome API key within Vinkius.
- 02 Tell your agent what you need. For example, 'Start a new roadmap for Q3' or 'Add market analysis pages to my existing deck'.
- 03 Your AI client executes the commands using the available tools and returns confirmation of the successful action.

The bottom line is that your agent handles all the API calls so you just talk through your presentation plan.

Built For

Content Creators, Marketing Managers, and Product Managers who spend too much time in web apps manually assembling slides. You're tired of copy-pasting text between documents and wasting hours on basic structure work.

Marketing Manager

Builds campaign decks for different clients, needing to quickly create multiple new tomes in a centralized workspace.

Product Manager

Documents feature roadmaps and product specs by generating entire project storyboards without leaving their Jira board or chat interface.

Content Creator

Needs to rapidly prototype stories, listing existing workspaces first so they can pick the right container for a new narrative.

What Changes When You Connect

- 01 Start fresh decks instantly. You can use the `create_tome` tool to generate new project storyboards in a specific workspace with simple instructions.

-
- 02 Expand existing content dynamically. If your narrative needs more detail, you just ask your agent to add pages using the `add_page` function.

 - 03 Never lose track of projects again. The MCP lets you list all available workspaces first, so you always know where every deck lives.

 - 04 Inspect project details fully. Use `get_tome` when you need to pull complete metadata on a specific presentation to check its structure before making changes.

 - 05 Manage your assets efficiently. You can use the agent to list all tomes in a workspace, giving you an immediate inventory of everything created.
-

Real-World Applications

Drafting a new product roadmap

A Product Manager needs to outline 'Product Roadmap 2025.' They ask their agent to create a tome titled 'Product Roadmap 2025' in the main company workspace. The MCP handles the creation and gives them immediate confirmation, letting them start adding content right away.

Organizing client assets

A Content Creator has dozens of projects across different clients. They first use the MCP to list all accessible workspaces, instantly sorting through their accounts and picking the correct container for a new story.

Updating an existing client pitch

A Marketing Manager has a pitch deck that needs a deep dive on competitor analysis. Instead of opening the file, they ask their agent to add pages with 'Market Analysis' data to the specific tome ID, updating the presentation structure in one go.

Reviewing project scope

Before collaborating on a deck, an agent uses `get_tome` to pull detailed information about the presentation's structure. This lets them check if all required sections are present before starting any writing.

Patterns to Avoid

Manual web app navigation

✗ AVOID

The user manually opens Tome, navigates to 'Workspaces,' selects the correct folder, then clicks '+ New Tome,' and finally enters the title.

✓ INSTEAD

Don't click anything. Just ask your agent: 'Create a new tome titled X in the Y workspace.' The MCP handles the entire sequence with `create_tome`.

Forgetting where to start

✗ AVOID

The user is unsure if they are working on the right project and wastes time checking multiple folders.

✓ INSTEAD

First, ask your agent to list all accessible workspaces using `list_workspaces`. This gives you a clean overview of every available container.

Overwriting work by accident

✗ AVOID

The user edits the wrong tome and loses hours of content because they couldn't easily verify its ID or structure.

✓ INSTEAD

Use the `get_tome` tool first. It pulls detailed information on a specific tome, confirming the correct metadata and current state before you make any changes.

The Right Fit

Use this MCP if your workflow centers around generating structured visual presentations or storyboards that require continuous management of workspaces and pages. You need conversational control over project structure—for instance, needing to list all accessible workspaces or add a specific page after the fact.

Do NOT use this MCP if you simply need to generate a single piece of text (like an article draft) or manage unstructured data (like a database record). For pure document generation, look for specialized content creation tools. If your primary goal is just reading and indexing existing knowledge, consider using a vector store type tool instead.

The hassle of building presentations today

Right now, building out complex narratives means opening the web app, navigating through workspaces, selecting the correct deck, and then clicking 'Add Page' repeatedly. You spend more time managing the structure—the right folder, the right title, the missing section—than you do actually writing content.

With this MCP, your agent handles that entire process conversationally. Instead of a series of clicks and dropdown menus, you just tell your agent what to build or where to put it. You get instant confirmation that the project is structured exactly how you need it.

Tome (AI Storytelling) MCP: Control Your Narrative Flow

The tedious steps of opening a workspace, checking if the tome exists, and then manually adding new pages are gone. The agent can manage these prerequisites for you using tools like `list_tomes` or creating an entirely new project with `create_tome`.

You don't just get content; you get reliable structural control. You dictate the flow of the presentation, page by page, without ever touching a manual button.

Tome (AI Storytelling): 5 Tools

Use these tools to list workspaces, create new decks, get tome details, or add pages directly from any AI client.

#	TOOL	DESCRIPTION
01	<code>add_page</code>	Adds a specified page of content directly into an already created tome structure.
02	<code>create_tome</code>	Generates a new, empty presentation deck (tome) inside a selected workspace.
03	<code>get_tome</code>	Pulls comprehensive data about one specific tome, showing its current pages and metadata.
04	<code>list_tomes</code>	Retrieves a list of all existing tomes contained within the currently targeted workspace.
05	<code>list_workspaces</code>	Fetches and displays a complete inventory of available Tome workspaces connected to your account.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U List all my Tome workspaces.

I've retrieved your workspaces. You have access to: 'Personal Space' (ID: ws_987) and 'Design Team' (ID: ws_654). Which one would you like to explore?

U Create a new tome titled 'Product Roadmap 2025' in workspace ws_987.

Successfully created! Your new tome 'Product Roadmap 2025' is now live in your Personal Space with ID: tome_abc123. Would you like to add the first page?

U Add a page called 'Market Analysis' to tome tome_abc123.

Done. I've added the 'Market Analysis' page to your tome. You can now see it in the presentation structure.

Frequently Asked Questions

01 How do I list all my workspaces using Tome (AI Storytelling)?

You ask your agent to use the `list_workspaces` tool. It will retrieve a complete inventory, allowing you to select the correct container for your project before doing anything else.

02 Can I add pages to an existing tome using Tome (AI Storytelling)?

Yes, use the `add_page` function. You simply tell your agent which tome and what content you want added, letting it handle the page insertion.

03 What if I need to start a completely new presentation deck?

Use the `create_tome` tool. Just specify the title and target workspace, and your agent handles generating the empty project for you.

04 Does Tome (AI Storytelling) MCP only work with one type of content?

No. It manages tomes that can hold various types of narrative data, allowing you to build everything from product roadmaps to marketing campaigns.

05 How do I check the details of a specific tome?

Use `get_tome`. This tool pulls all the detailed metadata and structural information for one presentation deck, letting you verify its contents before making changes.
