

MCP SERVER

NO CODE

CLOUD HOSTED

Veeqo MCP

Manage Multi-Channel Orders & Inventory Flow

Veeqo connects your AI agent directly to your multi-channel e-commerce backend, giving you real-time control over inventory, orders, and shipments from Amazon, Shopify, and more. Manage everything—from checking stock levels across warehouses to creating manual orders for specific customers—all through natural conversation.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Veeqo MCP

7 tools available

Cloud-hosted on Vinkius

Running an online store means juggling dozens of dashboards: one for Amazon, another for Etsy, a third for your local warehouse system. This MCP lets you manage all that complexity from a single chat interface. You can tell your agent to check if the 'Blue T-Shirt' is in stock and then ask it to compile a list of all pending shipments needing tracking numbers. The platform handles fetching sales orders, pulling specific customer data, and even building new fulfillment records when needed. All you do is talk to your agent. It pulls that order information, cross-references the product catalog for accurate SKUs, and gives you an immediate status update on shipping history. Through Vinkius, you get a single point of control over your entire retail operation without ever leaving your workspace.

Core Capabilities

01 — Check Stock Levels

Query the current available stock count and detailed metadata for any product in your catalog.

02 — List Orders

Retrieve a comprehensive list of all sales orders that have come through your system.

03 — Get Order Details & Create Manual Fulfillment

Inspect any specific order for line-item details, or manually create new fulfillment records when needed.

04 — Monitor Shipments and Customers

Track the status of outgoing shipments or list customer contact information associated with past orders.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/veeqo — connect your AI agent in three steps.

- 01** First, subscribe to this MCP on Vinkius and enter your specific Veeqo API key found in your user profile settings.
- 02** Next, trigger the workflow using natural language prompts within any compatible AI client.
- 03** The agent executes the necessary actions against your account and returns structured data—like stock counts or order lists—directly to you.

The bottom line is that you talk to your agent like talking to a coworker, and it talks directly to your e-commerce backend for answers.

Built For

This MCP is built for Operations Managers and E-commerce Coordinators who are tired of clicking through four different dashboards just to fulfill one order. If you spend your day copying SKUs from Amazon into Shopify, this saves you hours.

E-commerce Manager

Needs instant visibility on inventory health and must quickly check stock levels across multiple channels before promising a delivery date.

Operations Coordinator

Manages the physical fulfillment process, requiring them to track specific shipments and create manual orders for urgent customer requests.

Retail Business Owner

Wants a single view of sales history and product performance without having to export data into spreadsheets every week.

What Changes When You Connect

- 01** Stop jumping between systems. You can check stock levels and list orders using your agent, keeping all e-commerce data in one conversation.

-
- 02** Fulfill orders faster by letting the agent retrieve line-item details for any given order number, saving you from digging through multiple tabs.

 - 03** Keep clean records by listing customer information directly. You get access to core CRM data without having to download and manage CSV files.

 - 04** Stay ahead of logistics issues. Use the MCP to list shipments and pull current tracking numbers so you can give accurate updates to customers instantly.

 - 05** Maintain product accuracy with `get_product_details`. This tool fetches detailed metadata, letting you verify SKUs or variant status before placing a large order.

 - 06** Need an urgent fulfillment? You can use the agent to create manual orders for specific customers when automated processes fail.

-

Real-World Applications

A Customer Calls Asking About Shipping Status

Instead of asking a coworker, you simply ask your agent: 'Show me the last 3 shipments and their tracking numbers.' The MCP uses `list_shipments` to pull the exact data, so you can give the customer an immediate, accurate answer.

Correcting a Mistake in an Order

A customer needs a product added that wasn't part of their original order. You tell your agent to use `get_product_details` to verify the correct SKU, and then instruct it to `create_manual_order` for the missing item.

Running End-of-Day Inventory Reconciliation

You prompt your agent: 'List all products and check their current stock.' The MCP uses `list_inventory_products` and related tools to give you a full inventory snapshot, letting you spot discrepancies before the next day's sales start.

Investigating a Large Order Discrepancy

The sales team reports an order that is showing weird items. You ask your agent to use `get_order_details` on the specific order ID, which breaks down every line item and associated customer data using `list_customers`.

Patterns to Avoid

Treating it like a search engine

X AVOID

Trying to ask vague questions like: 'Tell me about my orders.' This gives you nothing useful and requires multiple follow-ups.

✓ INSTEAD

Be precise. Tell your agent exactly what data you need, for example: 'List all active sales orders in the past 7 days' or use ``list_orders``.

Ignoring product specifics

X AVOID

Asking only 'What are my products?' This gives a list of names but no vital details like current stock counts.

✓ INSTEAD

Always follow up with specific data requests. After listing inventory, ask the agent to ``get_product_details`` for a specific SKU to get metadata and variant status.

Manual data transfer

X AVOID

Having to copy customer IDs from one spreadsheet into another system because of an order change.

✓ INSTEAD

Use the MCP to list customers, then tell your agent what action to take on that roster. This keeps the process inside the AI chat and minimizes manual input.

The Right Fit

Use this MCP if your bottleneck is accessing and synthesizing data across multiple e-commerce platforms (Amazon, Shopify, etc.). If you spend more time gathering information than actually fulfilling orders, this is for you. However, don't use it just because you need a better way to run reports. While you can list orders or products, the MCP isn't a replacement for deep analytical BI tools like Tableau; it's designed for transactional data retrieval and action (like creating an order). If your primary need is complex financial forecasting or advanced marketing attribution modeling, look at specialized accounting or analytics connectors instead.

The Daily Chore of E-commerce Fulfillment

Right now, fulfilling a single customer's request means opening the Amazon Seller Portal, checking inventory on your Shopify dashboard, then jumping over to your warehouse management system just to confirm shipping status. You spend minutes clicking between tabs and copy-pasting SKUs into separate spreadsheets—it's exhausting.

With this MCP, you simply tell your agent what needs to happen: 'Find the stock for SKU 4567, list all open orders for that item, and check its current shipment status.' The system pulls everything together for you in one conversation. You get immediate answers without leaving your chat window.

Streamlining Fulfillment with Veeqo MCP

You eliminate the need to manually verify product details, list out full order histories, or track dozens of shipments using separate logins and tools. All that disparate data is pulled into a coherent conversational flow.

What's different now is speed. You don't just get answers; you initiate actions—like creating manual orders—using nothing but plain English prompts.

Veeqo MCP with 7 Tools

Use these tools to perform specific actions like listing order records, checking product metadata, or creating manual fulfillment orders directly through your AI client.

#	TOOL	DESCRIPTION
01	<code>create_manual_order</code>	Allows you to build and submit a new fulfillment order for any customer.
02	<code>get_order_details</code>	Pulls all the specific items, costs, and details associated with a single sales order number.
03	<code>get_product_details</code>	Retrieves comprehensive metadata and status information for any product SKU in your system.
04	<code>list_customers</code>	Generates a list of all customers stored in your Veeqo account.
05	<code>list_orders</code>	Provides an overview and listing of multiple sales orders that have been placed.
06	<code>list_inventory_products</code>	Lists all products currently recorded in your inventory catalog.
07	<code>list_shipments</code>	Shows a history of outgoing packages and their current tracking statuses.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U List all active orders in my Veeqo account.

I've retrieved your orders. You have 5 active sales orders including #10293, #10294, and #10295. Their statuses range from 'Awaiting Shipment' to 'Picking'. Which one should we inspect?

U Check the current stock for 'Blue T-Shirt' in the inventory.

Fetching product details... The 'Blue T-Shirt' (SKU: TS-BLUE-01) has 42 units remaining in your main warehouse and 15 units in the secondary location. Shall I set a low-stock alert?

U Show me the last 3 shipments and their tracking numbers.

I've retrieved the latest shipments: #SH-8823 (Track: 1Z99...), #SH-8824 (Track: 1Z88...), and #SH-8825 (Track: 1Z77...). All have been dispatched successfully via UPS.

Frequently Asked Questions

01 How does the Veeqo MCP handle multiple channels?

The MCP aggregates data from all connected sales channels, allowing you to monitor inventory and list orders regardless of where they originated. It makes your multi-channel view singular.

02 Can I use the Veeqo MCP to check real-time stock?

Yes. The MCP uses the product details tools to query current stock levels across all recorded locations in your catalog, giving you immediate inventory visibility.

03 Is creating a manual order with the Veeqo MCP complicated?

No. You simply prompt the agent to create the order for specific customers or items, and it handles the necessary data structuring behind the scenes.

04 What if I need to check an old shipment status using the Veeqo MCP?

You can use the list_shipments tool to pull your fulfillment history. This lets you track packages and review past shipping records easily.
