

MCP SERVER

NO CODE

CLOUD HOSTED

Vinkius Catalog Discovery MCP

Find any integration in the entire ecosystem by asking questions.

Vinkius AI Catalog gives your agent direct, programmatic access to every MCP available in the Vinkius ecosystem. Instead of guessing what tools exist out there, you can search, browse, and analyze the entire catalog's taxonomy, documentation, and statistics—all through natural language queries.

A+ Quality Score 98.33/100

debugger

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Vinkius AI Catalog MCP

12 tools available

Cloud-hosted on Vinkius

Turn your AI client into a complete intelligence operator for the whole Vinkius library. This MCP hands your agent direct access to every single integration in the largest curated collection of MCPs available. You can use it to search the entire catalog with simple questions, or you can browse by specific categories and tags to understand the ecosystem's full scope. Need to know how many integrations are for finance? Ask. Want to see which types of tools exist across all sectors? The agent handles that. It even lets you inspect a complete profile for any integration, pulling up its exposed tools, FAQs, suggested prompts, and developer grades instantly. Since Vinkius hosts this catalog, your agent always has the most current data on available tooling.

Core Capabilities

01 — Search all integrations

Find specific MCPs by asking natural language questions or using keyword searches across the entire library.

03 — Review specific MCP details

Pull up a full profile for any single integration, including its complete list of tools, developer FAQs, and example prompts.

02 — Analyze catalog structure

Retrieve lists of featured categories, general categories, and every existing tag to map the entire tool ecosystem.

04 — Monitor catalog growth

Get real-time statistics on the total number of MCPs available in the Vinkius marketplace.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/vinkius-mcp-catalog — connect your AI agent in three steps.

- 01 Tell your agent what you need to find, such as 'Show me all finance tools' or 'What tags are related to CRM?'
- 02 The MCP executes a search against the Vinkius index and compiles the relevant data points like total counts, featured sections, and matching integrations.
- 03 Your agent presents the results—whether it's a list of 10 potential tools or a detailed profile for one specific integration.

The bottom line is you get programmatic access to Vinkius's entire index of available tools, turning discovery into a simple query.

Built For

Platform architects and AI developers need this. If your job involves understanding the full scope of potential integrations or figuring out what services are missing from your current toolset, this is for you. It takes the guesswork out of platform planning.

AI Agent Developer

Using `search_catalog` and `get_listing` to discover suitable MCPs programmatically before writing complex automation workflows.

Platform Architect

Auditing the catalog using `get_all_categories` and `get_all_tags` to map out the current tool ecosystem and identify potential gaps in functionality.

Growth Engineer

Monitoring trends by running `get_catalog_stats` and checking featured categories to inform strategic product positioning within the marketplace.

What Changes When You Connect

-
- 01** Stop guessing what tools are available. Using `search_catalog` lets you find integrations across all industries using plain language queries, saving hours of manual browsing.

 - 02** Understand the full scope of the platform's capabilities. Tools like `get_all_tags` and `get_all_categories` map out every single niche and category existing in the Vinkius marketplace.

 - 03** Validate your assumptions before development. You can use `get_listing` to pull up a complete profile, including tools and FAQs, for any MCP you might want to incorporate.

 - 04** Track platform maturity instantly. By running `get_catalog_stats`, you immediately know how large the overall ecosystem is without needing to click through pages.

 - 05** Get expert insights right away. You can use `get_listing_prompts` to see exactly what kind of input and output an MCP expects, preventing integration failures.
-

Real-World Applications

Mapping the full developer landscape

A Platform Architect needs to know if Vinkius supports any tools for local government compliance. They run a query through `search_catalog` and immediately get results, confirming 5 specialized MCPs are available before committing development resources.

Investigating competitor integrations

A Growth Engineer wants to know if there are any tools for video editing or specialized media handling. They use `get_categories` and find a 'Media' section, allowing them to adjust their content strategy immediately.

Onboarding new team members

A new AI Agent Developer wants to understand the different types of data sources available. They use `get_all_tags` and see everything from 'finance' to 'supply-chain', giving them a clear map of what they can build.

Debugging integration requirements

An Agent Developer is stuck on an API connection. They use `get_listing` and examine the related listings for other similar tools, finding a specific required authentication method that solves their problem.

Patterns to Avoid

Using only basic keyword search

✗ AVOID

The user types 'marketing' into the search bar and gets 50 results, but they can't tell if those tools are for email marketing or social media analytics.

✓ INSTEAD

Instead, ask your agent to 'Show me MCPs tagged with both marketing AND social media'. This precise query uses the underlying `search_catalog` engine to narrow down exactly what you need.

Assuming all tools are ready-to-use

✗ AVOID

The user sees an exciting tool listed but doesn't know if it requires special credentials or setup, leading to failed runs.

✓ INSTEAD

Always check the full profile using `get_listing`. This provides context on required authentication and gives you a clear picture of the tool's prerequisites.

Overlooking category structure

✗ AVOID

The user is looking for scheduling tools but gets lost browsing general 'productivity' listings that mix calendar apps with simple to-do lists.

✓ INSTEAD

Use `get_featured_categories` or `get_all_categories` first. This lets you navigate directly to a specialized section, like 'Project Management,' for better results.

The Right Fit

You should use this MCP if your primary need is understanding the scope of available tooling. If you're an architect trying to map out a technical landscape or a developer scoping a new project, this catalog access is essential. Use it when you need to know *what* exists before figuring out *how* to build it. Don't use it if you already know exactly which MCP you want; in that case, just connect and use the tool directly. Also, don't use it just to browse—it's a discovery engine, not a content feed. If all you need is random inspiration, try `get_random_listings`, but if you need reliable data, start with `search_catalog`.

The Pain of Tool Discovery

Today, figuring out what tools are available feels like sifting through a mountain of documentation. You open one tab for 'finance,' another for 'CRM,' and yet another for 'marketing data.' You end up manually checking dozens of links, hoping to find the specific integration you need without wading through irrelevant results.

With this MCP, that manual effort vanishes. Your agent handles the entire process. You just ask a question—like, 'I need an integration for tracking supply chain inventory'—and it gives you targeted options from across the whole Vinkius catalog.

Accessing the Full MCP Catalog

You no longer have to rely on guessing or reading multiple README files. Instead, your agent can run `get_all_tags` to show you every single niche and category that exists in Vinkius, giving you a complete map of possibilities.

It's not just about finding one tool; it's about understanding the entire ecosystem. This gives you confidence in your architecture because you know exactly what services are available right now.

Vinkius AI Catalog: 12 Tools

Use these tools to programmatically search, categorize, and inspect every single integration within the Vinkius ecosystem.

#	TOOL	DESCRIPTION
01	<code>browse_listings</code>	Browse through available MCPs with filters, sorting options, and pagination controls.
02	<code>get_catalog_stats</code>	Retrieves the total count of all MCPs currently hosted in the catalog.
03	<code>get_categories</code>	Lists editorially featured categories along with a sample of associated MCP listings.
04	<code>get_category_sections</code>	Retrieves all specific sections and sorted listings within one chosen category.
05	<code>get_all_categories</code>	Paginates through every single official category in the catalog, including listing counts for each.
06	<code>get_all_tags</code>	Lists every tag used across all MCPs and shows how many integrations use that specific label.
07	<code>get_featured_categories</code>	Retrieves a curated list of top-level categories selected by the platform editors, with examples of included MCPs.
08	<code>get_listing_faqs</code>	Fetches specific Frequently Asked Questions and answers for a single listed MCP.
09	<code>get_random_listings</code>	Retrieves a batch of random, randomly selected MCPs from the catalog for general discovery.
10	<code>search_catalog</code>	Searches the entire Vinkius MCP library using natural language queries or specific keywords.
11	<code>get_listing_prompts</code>	Retrieves examples of effective prompts and expected responses for a single listed MCP.
12	<code>get_listing</code>	Pulls the complete profile for one specific MCP, including its tools, FAQs, related integrations, and category placement.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Search the Vinkius catalog for CRM integrations.

I found 8 CRM MCPs in the catalog. Top results: HubSpot Integration (Grade A, 12 tools), Salesforce Connector (Grade B, 8 tools), and Pipedrive Analytics (Grade B, 5 tools). Want me to show the tools and FAQ for any of these?

U Show me the full details and tools of the Kaggle Market Intelligence MCP.

Here's the full profile for Kaggle Market Intelligence: it has 6 tools (dataset search, competition scanning, community engagement, etc.). Debugger Grade: A (92/100). Trust Score: 92 (Verified). Requires Kaggle API credentials (username:key format). Want me to show the FAQ or prompt examples?

U What categories are available in the catalog?

The Vinkius catalog has 12 active categories. Featured: Developer Tools (45 MCPs), Social Media (38 MCPs), Growth Engine (22 MCPs), AI Platforms (19 MCPs). Want me to browse MCPs in a specific category?

Frequently Asked Questions

01 Do I need credentials to use this MCP?

No. The Vinkius catalog is fully public. All search, browse, and detail operations work without any credentials.

02 What data does the search return?

Search returns MCP cards with title, description, slug, tool count, debugger quality grade, and auth requirement. Results are ranked by relevance using AI-powered keyword extraction.

03 Can I filter by category and server type simultaneously?

Yes. All filter parameters (category, tag, server_type) can be combined in both search and browse operations for precise results.

04 What does the debugger grade mean?

Each MCP is scanned by the Vinkius Debugger, which grades quality from A (excellent) to F (critical issues). The grade reflects tool schema compliance, error handling, response consistency, and documentation completeness.
