

MCP SERVER

NO CODE

CLOUD HOSTED

Webflow Alternative MCP

Manage content and sites without opening a dashboard.

Webflow Alternative lets you manage entire web projects, CMS collections, pages, and assets directly through your AI client. Don't open the Designer; use this MCP to list sites, create new blog posts, update page SEO titles, or even trigger a full site publish cycle with natural language prompts. It gives developers and content teams programmatic control over every aspect of their Webflow build.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Webflow MCP

19 tools available

Cloud-hosted on Vinkius

Need to manage a set of web properties without logging into the dashboard? This MCP connects your AI agent directly to the Webflow Data API v2, giving you granular control over your site structure and content. You can list all accessible sites to check status or gather metadata. Need to update 50 blog posts' titles and descriptions across multiple collections? Your agent handles that bulk workflow. It lets you create new CMS items, manage media assets—uploading images or deleting old ones—and even set up webhooks for real-time event triggers. If you're already using Vinkius as your central catalog, adding this Webflow connection means all your design and content tasks are run from one place.

It's about treating the entire site like a database: listing pages, retrieving collection details, updating specific fields on items, or publishing the whole thing when it's ready. No GUI required.

Core Capabilities

01 — Site Discovery and Status Check

List all Webflow sites associated with your account to check their metadata and current status.

03 — Page Metadata Updates

Retrieve details for specific web pages and modify their SEO titles and descriptions without touching the Designer tool.

05 — Site Publishing and Deployment

Trigger the publishing process for an entire Webflow site to its live domains when content is finalized.

02 — Content Management System (CMS) Control

Programmatically list, create, update, or delete entire content collections and individual items within them.

04 — Asset Library Management

List, upload, or delete media files (images, videos) from your site's central asset library.

06 — Webhooks and Forms Access

View form submissions or set up real-time event triggers using webhooks on your sites.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/webflow-alternative-1 — connect your AI agent in three steps.

- 01 First, subscribe to this MCP and provide your Webflow API Token (v2).
- 02 Next, reference the site or content you want to modify within your AI client prompt.
- 03 Your agent executes the specific action—like creating items or updating page metadata—and reports success or failure back to you.

The bottom line is that you run complex web management tasks through natural conversation, getting structured data and confirmations in return.

Built For

This MCP is for the developer who hates logging into a GUI just to check site status. It's for the content manager drowning in spreadsheets trying to update hundreds of product pages. And it's for the SEO specialist who needs to audit page metadata across dozens of client sites quickly.

Web Developer

They use this MCP to check site status or programmatically create items in a CMS collection, integrating Webflow data into automated deployment scripts.

Content Manager

They ask the agent to bulk update blog posts, handling content creation and deletion of items across multiple collections.

SEO Specialist

They leverage this MCP to audit site metadata, updating SEO titles or descriptions for pages on a large scale without manual intervention.

What Changes When You Connect

- 01 Update CMS items or page metadata directly from your terminal. Instead of navigating through the Webflow designer, you can tell your agent to update 50 product descriptions using `update_items` or `update_page`.

- 02 Automate deployment steps. Use `list_sites` first to confirm all target sites are online, then trigger a full publish cycle with `publish_site`, saving the manual process of checking status across multiple dashboards.

 - 03 Scale content creation effortlessly. If you have dozens of blog posts, your agent can use `create_items` in conjunction with provided data feeds, eliminating tedious copy-pasting into Webflow forms.

 - 04 Control site assets like a database. You don't need to manually upload images; the `upload_asset` tool lets you manage media files programmatically and then reference them for content creation.

 - 05 Audit your entire setup at once. Combine `list_pages` with `get_page` to quickly check every page's current SEO title, making a site-wide audit that used to take hours of clicking.
-

Real-World Applications

Migrating Content Before Launch

A developer needs to ensure 30 new product pages are live before launch. They tell their agent, 'Use `list_collections` to check the Product collection schema, then use `create_items` for all pending products.' This bypasses manual entry entirely.

Checking Site Health After Deployment

The ops engineer wants to know which sites are ready for launch. They call `list_sites`, review the metadata provided by `get_site` on key projects, and only run `publish_site` when all green lights are confirmed.

Urgent SEO Fix Across Many Sites

An SEO specialist realizes 15 important service pages are missing keywords in their titles. They instruct the agent to iterate through `list_pages`, then use `update_page` on each one with the correct metadata, solving a massive manual headache.

Building a Webhook Listener

The team needs to know instantly when a contact form gets filled out. Instead of relying on manual checks, they use the agent to call `list_forms`, then execute `create_webhook` to set up automatic data routing.

Patterns to Avoid

Trying to edit content fields in batches

X AVOID

A user tries to update 50 items by manually listing the ID, then calling `update_items` one time for each item's specific field.

✓ INSTEAD

Group your requests. Instead of repeating the call, ask your agent to use `list_items` first to get all IDs, and then pass that list back into a single prompt asking it to update all fields simultaneously via `update_items`.

Ignoring asset management

X AVOID

A user uploads a new image directly through the AI client without knowing its location or needing to delete old versions.

✓ INSTEAD

Always start by calling `list_assets` to see what's available. Then, use `upload_asset` for the new file and keep track of the asset ID so you can reference it correctly when using `create_items`.

Treating sites as isolated projects

X AVOID

A user only focuses on one specific site's content, missing other related web properties under the same account.

✓ INSTEAD

Start by calling `list_sites`. This gives you a master list of every project ID. You can then pass this full context to your agent so it knows which sites need attention when running tasks like `get_site`.

The Right Fit

Use this MCP if your job involves managing content, assets, or structure across multiple Webflow projects and you're tired of logging into the Designer for simple data checks. This is ideal for bulk operations: updating metadata on pages, creating large sets of CMS items, or triggering publications in sequence.

Don't use this if you just need to view a single page of content or write pure HTML/CSS. For those tasks, standard web development APIs are better. Also, don't confuse it with a simple form submission tool; while `get_form` helps you read the schema, actual interaction requires calling `create_webhook`. When in doubt about bulk actions, always reference the available tools like `list_pages`, `get_page`, and `update_items` to ensure your agent knows exactly what it can manipulate.

The constant headache of jumping between dashboards.

Today, updating a small site means opening the webflow.com dashboard, navigating into the CMS panel, selecting the correct collection, finding the item you need, clicking 'edit,' and then manually tweaking fields like SEO Title or Description. If you have ten sites doing this, it's an hour of clicks, tabs, and copy-pasting.

With this MCP, you tell your AI agent exactly what needs changing—for example, 'Update the top 20 blog posts with keyword X.' Your agent handles the entire flow: listing collections, finding every item, running `update_items` on each one, and confirming success. You get instant confirmation; no dashboard clicks required.

Webflow Alternative MCP provides CMS automation.

The biggest time sink is the repetitive process of auditing and updating metadata across multiple collections. Instead of manually checking every page's SEO settings, you can use `list_pages` to get all IDs, then run a loop using `update_page` to

Your job changes from being a manual administrator who clicks buttons, to an architect who programs the workflow. You simply tell your agent the rule, and it executes the entire content lifecycle.

enforce consistent rules across hundreds of pages.

Webflow Alternative: 19 Tools for Site Management

These tools let you perform everything from listing every asset to publishing an entire site, giving your AI agent granular control over the Webflow API.

#	TOOL	DESCRIPTION
01	<code>list_assets</code>	Retrieves a list of media files uploaded to a specific Webflow site.
02	<code>list_collections</code>	Lists all structured content collections available on the site.
03	<code>create_items</code>	Generates new pieces of content (items) within a specified CMS collection.
04	<code>create_webhook</code>	Sets up a real-time event notification trigger for the site.
05	<code>delete_asset</code>	Removes an existing media file from the site's asset library.
06	<code>delete_items</code>	Bulk removes content items from a specified CMS collection.
07	<code>list_forms</code>	Shows all contact or submission forms configured for the site.
08	<code>get_collection</code>	Fetches detailed structure and information about a specific CMS collection.
09	<code>get_form</code>	Retrieves the data schema for a particular site form.
10	<code>get_page</code>	Gets all metadata and structural details for a single web page.
11	<code>get_site</code>	Retrieves comprehensive details about an entire Webflow site.
12	<code>list_items</code>	Lists all existing content items within a defined CMS collection.
13	<code>list_pages</code>	Retrieves a list of every page that exists on the site.
14	<code>publish_site</code>	Triggers and executes the publication process for the entire Webflow site.
15	<code>list_sites</code>	Lists every single web project accessible under your account.
16	<code>update_items</code>	Modifies specific data points for existing content items in a CMS collection.
17	<code>update_page</code>	Changes the metadata, like SEO title or description, on a specific web page.
18	<code>upload_asset</code>	Adds new media files to the site's asset library.
19	<code>list_webhooks</code>	Lists all configured real-time event triggers on the site.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U List all my Webflow sites and their IDs.

I've retrieved your sites. You have access to: 'Portfolio 2024' (ID: site_abc123) and 'Company Blog' (ID: site_xyz789).

U Show me the items in the 'Blog Posts' collection with ID 507f1f77bcf86cd799439011.

Fetching items... I found 3 items in that collection: 'How to use MCP', 'Webflow Tips', and 'AI Automation Guide'. Would you like the details for any of these?

U Publish the site with ID site_abc123.

Initiating publish for 'Portfolio 2024' (site_abc123)... The site has been successfully queued for publishing to its configured domains.

Frequently Asked Questions

01 How do I update SEO titles using Webflow Alternative MCP?

You use the `update_page` tool to modify metadata. You simply provide the page ID and the new title or description in your prompt, letting your agent make the API call.

02 Does Webflow Alternative MCP handle publishing sites?

Yes, it uses the `publish_site` tool to initiate deployment. Just be mindful that there's a rate limit of one successful publish per minute.

03 What if I want to add a new image? Should I use `upload_asset`?

Yep, you need `upload_asset`. This tool adds the file to the site's central media library. After uploading, you'll get an asset ID that you can then reference when creating content.

04 Can I delete multiple blog posts at once?

You use `delete_items` for this. First, you might call `list_collections` to confirm the right collection, and then specify which item IDs need removal in your prompt.

05 How can I check if my site has any forms?

You run `list_forms`. This shows all the submission points on the site. You can then use `get_form` to see what fields are expected for each one.
