

MCP SERVER

NO CODE

CLOUD HOSTED

WooCommerce Status Reader MCP

Instantly track orders and resolve WISMO queries.

The WooCommerce Order Status Reader MCP lets your AI agent instantly pull real-time order details directly from your store's backend. Use an existing order ID or a customer email address to check status, shipping method, and tracking numbers automatically. It's perfect for automating all 'Where is my order?' (WISMO) support queries without logging into any dashboard.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

WooCommerce Order Status Reader MCP

1 tools available

Cloud-hosted on Vinkius

Customer service agents spend huge chunks of time handling the same question: "Where is my order?" This MCP solves that by giving your AI agent read-only access to your WooCommerce store. You can connect this through Vinkius, and your agent instantly gets a verified feed of current order information.

It's designed strictly for reading data. Your agent pulls the status—whether it's processing, shipped, or completed—and automatically extracts key shipping details like tracking numbers and carrier names. It doesn't modify anything; it just tells you what happened. When a customer asks about Order #10452, your AI client finds that order by ID or email and gives the exact status and link immediately, letting the agent respond without ever opening a browser tab or searching through an admin panel. This capability means faster answers for customers and less headache for your team.

Core Capabilities

01 — Check real-time order status

The MCP retrieves the current fulfillment stage of any WooCommerce order.

02 — Find orders by customer email

You can search for recent orders using only a customer's registered email address.

03 — Extract tracking information

It automatically parses and delivers the shipping carrier, tracking number, and link associated with an order.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/woocommerce-order-status-reader — connect your AI agent in three steps.

- 01 Tell your AI agent to check an order using either a specific WooCommerce Order ID or the customer's email address.
- 02 The MCP uses this information to communicate with your store and pull the current data feed.
- 03 Your agent receives a structured response detailing the status, shipment method, and any available tracking links.

The bottom line is that you get immediate, accurate order data fed right into your conversation flow, without needing manual lookups.

Built For

Anyone whose day involves repetitive customer inquiries about shipping status. This is for the support agent who dreads logging into three different systems to answer one question, and for e-commerce operations managers who need reliable automation.

Customer Support Agent

Handles high volumes of 'Where is my order?' chats by passing the Order ID or email to your agent.

E-commerce Operations Manager

Sets up automated support workflows that provide accurate, real-time tracking data without manual intervention.

Digital CX Developer

Builds conversational AI assistants that require validated order status and shipping details to function correctly.

What Changes When You Connect

- 01 Stop asking customers for IDs. Your agent can find an order just from their email, drastically improving the initial support experience.
- 02 Get verified tracking numbers automatically pulled out of WooCommerce's metadata, so your AI client can provide working links immediately.
- 03 Keep it read-only and safe. This MCP only gives access to viewing status; nothing can be modified, refunded, or canceled by the agent.
- 04 Handle high volumes of 'Where is my order?' queries without overloading human agents with repetitive lookups.
- 05 The ability to check orders by ID or email means your agent has maximum flexibility for any customer query.

Real-World Applications

Customer asks about a delayed shipment

A user types, 'My order #10452 is late.' The agent uses the ``read_woocommerce_order`` tool to confirm the actual status. Instead of guessing, the AI replies: 'It shipped via FedEx and tracking number 1Z... confirms it's out for delivery today.'

Support team handles peak holiday traffic

During a major sale, support agents use this MCP to check dozens of orders quickly. Instead of copying data between tabs, they pass the ID or email into their agent, which instantly returns structured status updates.

New customer needs a quick check

A new visitor emails support asking about their recent purchase. The agent uses the customer's email address to run ``read_woocommerce_order``, confirming the order details and providing shipping status immediately.

Debugging order fulfillment issues

An ops manager uses the tool's read-only capabilities to check if an order is stuck in 'Pending Payment' when it shouldn't be. This pinpoints whether the issue is system failure or a payment hold.

Patterns to Avoid

Trying to process refunds

✗ AVOID

The agent thinks that since they can 'read' the order, they can also use the tool to initiate a refund or cancel it.

✓ INSTEAD

This MCP is strictly read-only. If you need to issue refunds or change order status, you must connect an administrative endpoint designed for transactions, not this reader.

Using email when ID is available

✗ AVOID

The agent searches by customer email even though they were given the specific Order ID, making the process longer and more complex.

✓ INSTEAD

Always prioritize using the `read_woocommerce_order` tool with the specific Order ID if you have it. It's the most direct path to the status.

Assuming all orders are ready

✗ AVOID

The agent sees an order and assumes it shipped, but forgets to check the actual tracking meta data.

✓ INSTEAD

Always let your AI client use `read_woocommerce_order` because it automatically parses the necessary shipping details, ensuring you have verified carrier names and numbers.

The Right Fit

Use this MCP if your primary goal is to answer 'Where is my order?' questions using existing data. It's perfect for building read-only support bots that need status updates or tracking links. Don't use it if you need to change anything—like creating a refund, updating an address, or marking an order as paid. For those actions, you need an MCP with write permissions (a 'write' tool). This is solely for data retrieval; think of it like viewing an invoice, not signing the contract.

Dealing with shipping status means jumping through hoops.

Right now, if a customer asks about an order, your support agent has to manually log into WooCommerce. They search by ID or email, find the correct tab, copy the tracking number, and then paste it into the chat window. This process is slow, prone to human error, and requires multiple context switches.

With this MCP, that whole routine vanishes. Your AI client handles the login, the searching, and the data extraction behind the scenes. You just get a clean status report—all the details packaged up for an immediate, accurate reply.

WooCommerce Order Status Reader: Instant Tracking Data

You eliminate the need to manually navigate between order ID lookup and tracking number extraction. The agent doesn't just get 'Shipped'; it gets the carrier, the official link, and the exact date of shipment.

The difference is speed and reliability. Your support process moves from a multi-step manual task to a single, reliable API call—instantly.

WooCommerce Order Status Reader: 1 Tool Available

Use these tools to query your store's backend data, getting real-time status updates and shipping tracking details for WooCommerce orders.

| # | TOOL | DESCRIPTION |
|----|-------------------------------------|---|
| 01 | <code>read_woocommerce_order</code> | Reads the real-time status of a WooCommerce order using either an Order ID or customer email. |

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U A customer is asking for the status of order #10452. Can you check it for them?

I've checked the status of Order #10452. It is currently **COMPLETED** and was shipped via FedEx. The tracking number is 1Z9999999999999999.

Frequently Asked Questions

01 Can I use WooCommerce Order Status Reader MCP with my custom email field?

The tool requires either the specific Order ID or the customer's registered email address. It cannot search using arbitrary text fields outside of those two parameters.

02 Is reading order status safe for my data?

Yes, this MCP is strictly read-only. Your agent can view statuses and tracking details but cannot issue refunds or modify any part of the order record.

03 How do I check an order without knowing the ID?

Use your AI client to invoke `read_woocommerce_order` by providing only the customer's email address. The tool will search for their most recent orders instead.

04 Does WooCommerce Order Status Reader MCP work with all WooCommerce setups?

It connects via standard WooCommerce APIs, making it reliable for most standard installations. Always check your specific setup documentation if you use custom plugins that alter core order meta data.

Go Live in 60 Seconds

Get your connection token from cloud.vinkius.com, then paste the endpoint URL into any MCP-compatible client.
