

MCP SERVER

NO CODE

CLOUD HOSTED

WordPress MCP

Control your entire website's content from conversation.

WordPress MCP lets you manage your entire website's content—posts, pages, media, users, categories—directly through natural conversation. Skip the admin dashboard login; interact with every piece of site data from any compatible AI client.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

WordPress MCP

10 tools available

Cloud-hosted on Vinkius

Need to make changes on a WordPress site but don't want to log into the WP-Admin dashboard? This MCP connects your favorite AI agent straight to your content backend, letting you treat your entire website like a database you can chat with. You can ask it to list all published blog articles or check if a specific user still needs access. It handles everything from drafting and setting post statuses to listing every uploaded image's URL for social media campaigns. Accessing this level of control is usually buried in menus, but here, your agent makes it conversational. Through Vinkius, you get one entry point that lets any MCP-compatible client take over the manual labor of content management, letting you focus on writing and strategy instead of clicking through tabs.

Core Capabilities

01 — Manage all core site content

You can create new posts, update existing ones, or change their publication status (draft, private, published) using a simple chat command.

03 — Handle media assets

It retrieves a complete list of uploaded images and documents, giving you their direct public URLs for immediate use in external campaigns or reports.

05 — Clean up old site data

The system allows you to safely trash or permanently delete obsolete posts through chat commands, maintaining your content's integrity.

02 — Audit and organize content structure

The MCP lists all site categories, tags, users, and static pages so you can see exactly how your content is organized.

04 — Maintain content history

You can retrieve full details about any post, checking its status, featured media, and underlying technical data.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/wordpress — connect your AI agent in three steps.

- 01** Subscribe to this MCP and provide your WordPress Base URL, Username, and Application Password credentials.
- 02** Connect your preferred AI client (like Claude or Cursor) to the Vinkius catalog using the authorized credentials.
- 03** Start by asking a question like, 'List all draft posts for me,' and let your agent perform the actions conversationally.

The bottom line is that you never have to manually navigate the WordPress backend again; you just ask your agent what you need.

Built For

This MCP is for anyone whose job involves managing content on a large, active website. It's perfect for the copywriter who needs to publish a draft immediately, the marketing manager needing media links in bulk, or the developer testing site boundaries without touching code.

Content Writer

Drafting new articles and checking if the publication status of old posts is correct before hitting send.

Marketing Manager

Bulk-retrieving direct URLs for images or verifying that all campaign pages are published correctly.

CMS Administrator

Running audits to list users, check site categories for consistency, and permanently deleting outdated articles.

Web Developer

Testing the content structure by listing post details or verifying how static pages are connected to the main site architecture.

What Changes When You Connect

-
- 01 Publish and revise content instantly. Instead of manually navigating to the editor, you can use `create cms post` or `update cms post` to draft articles and set their status (draft/publish) in a single chat turn.

 - 02 Never lose track of media assets again. You just ask for it, and the MCP uses `list media attachments` to provide all direct public URLs needed for social posting or external embedding.

 - 03 Audit your site structure with confidence. Use tools like `list site categories`, `list site tags`, and `list site users` to quickly verify consistency and find orphaned content without manual clicking.

 - 04 Check the status of any piece of content. The `get post details` tool lets you instantly retrieve full technical details for a specific post, checking its featured media or publication date when needed.

 - 05 Maintain data integrity with safety. Need to clean up old articles? You can safely use `delete cms post` through your agent instead of manually finding and deleting them in the trash bin.
-

Real-World Applications

The Campaign Launch

A marketing manager needs to gather images for a new product launch email. Instead of browsing the Media Library, they ask their agent to use `list media attachments`. The agent returns a list of all relevant image URLs instantly, allowing them to build the campaign without leaving the chat window.

The Draft Push

A content writer finishes an article and needs it live. They instruct their agent to use `create cms post`, specifying the title, body, and 'publish' status. The post goes live instantly without ever opening the WordPress editor.

The Site Cleanup

A CMS administrator notices outdated content. They ask their agent to `list_site_posts` filtered by a specific date range, review the list for obsolete articles, and then use `delete_cms_post` on any items that need permanent removal.

The Feature Validation

A developer needs to check if the 'Contact Us' page content is structured correctly. They ask the agent to `list_static_pages`, verify the title, and then use `get_post_details` on that specific page ID to confirm its metadata.

Patterns to Avoid

Manual Status Updates

X AVOID

A writer drafts an article but forgets to manually change the status from 'draft' to 'pending review' in the admin dashboard.

✓ INSTEAD

Just tell your agent to `update_cms_post` for that post ID and set the status field. It handles the backend update instantly.

Searching by Memory

X AVOID

A manager remembers an image was uploaded but can't recall the exact name or folder path to find it in the Media Library.

✓ INSTEAD

Use `list_media_attachments`. The agent will list all files and give you their direct public URLs, letting you locate it immediately.

Incomplete Deletion

X AVOID

A user deletes an article but doesn't verify that the post has no associated categories or tags that are now orphaned.

✓ INSTEAD

First, run `list_site_categories` and `list_site_tags`. Then, you can use those tools to ensure your content is properly organized before deletion.

The Right Fit

Use this MCP if your core workflow involves reading, writing, or modifying structured content on a WordPress site. Specifically, when you need to create new posts (`create_cms_post`), change existing data (`update_cms_post`), or audit the relationships between users, categories, and media. Don't use this if you are trying to redesign the entire look of your site (that requires CSS/theming tools). Also, don't use it if you only need general web browsing; if

that's the case, a general search tool is better than one focused on content structure.

Managing content means constant context switching.

Right now, managing a website's content requires logging into the WP-Admin dashboard. You jump from checking user permissions to listing categories, then opening an article to change its status, and finally downloading media links—all requiring dozens of clicks across different tabs and screens.

With this MCP, you talk to your agent like you talk to a coworker. Instead of logging in, you simply tell the agent what needs doing. It handles the underlying data calls—listing posts with `list_site_posts`, verifying users with `list_site_users`, or updating status—and gives you the result immediately.

The WordPress MCP delivers conversational content control.

You eliminate the tedious steps of dashboard navigation, clicking through multiple menus to find a post's metadata. You don't have to manually open an article just to read its details; you ask for them and get the full output via `get_post_details`.

The site is now fully accessible through natural conversation. It's not about where you are in the dashboard anymore—it's about what you need to do, and your agent handles the rest.

WordPress: 10 Content Management Tools

These tools allow you to interact with every part of your WordPress site—from listing users and tags to creating and updating full posts—all through natural conversation.

#	TOOL	DESCRIPTION
01	<code>delete_cms_post</code>	Permanently deletes a specific WordPress article, either sending it to trash or forcing immediate removal.
02	<code>create_cms_post</code>	Generates a brand new post with content and title, setting its initial status as draft, private, or published.
03	<code>get_post_details</code>	Pulls all the specific information for one WordPress article by ID.
04	<code>list_site_categories</code>	Retrieves a complete list of every category defined across your entire site.
05	<code>list_media_attachments</code>	Lists all image and document files stored in the WordPress media library.
06	<code>list_static_pages</code>	Shows a list of pages that are not blog posts, like 'About Us' or 'Contact'.
07	<code>list_site_posts</code>	Lists multiple articles from the site, supporting filters by category or pagination.
08	<code>list_site_tags</code>	Retrieves a full list of all tags used across your entire website content.
09	<code>list_site_users</code>	Lists every user account registered on the WordPress site, including their numeric ID.
10	<code>update_cms_post</code>	Changes specific fields of an existing post after you provide the post's unique ID.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U List the last 5 posts on my WordPress site.

I found your 5 most recent posts: 1. 'Welcome to 2026' (ID: 101, Status: publish), 2. 'New Product Features' (ID: 102, Status: draft), 3. 'Our Vision' (ID: 103, Status: publish), and 2 others. Which one would you like to see the details for?

U Create a new draft post titled 'AI in Marketing' with content '`<p>AI is changing everything...</p>`'.

Success! I've created a new draft post titled 'AI in Marketing' (ID: 155). It is currently saved as a draft. Would you like me to add any tags or categories to it?

U List all categories on my WordPress site.

I found 4 categories: 'News' (ID: 1), 'Tutorials' (ID: 2), 'Product Updates' (ID: 3), and 'Case Studies' (ID: 4). Would you like to see how many posts are assigned to each?

Frequently Asked Questions

01 How does the WordPress MCP handle media attachments?

The MCP uses `list_media_attachments` to list all image and document files. You receive their direct public URLs, which you can immediately use for external campaigns or embeds.

02 Can I write a new draft post using the WordPress MCP?

Yes. Use `create_cms_post` to define the title and content, setting its initial status as 'draft' so it saves without being published immediately.

03 What if I need to delete a lot of old posts?

You can first use ``list_site_posts`` to filter and review the articles you want gone. Once confirmed, you use ``delete_cms_post`` to remove them safely.

04 Does WordPress MCP help with site categories?

Yes, it uses ``list_site_categories`` to list all defined categories and tags. This is great for auditing your content structure.

05 How do I update an existing blog article's status?

You use the ``update_cms_post`` tool, providing the post ID and specifying a JSON object containing the field you need to change (like setting the status from draft to published).
