

MCP SERVER

NO CODE

CLOUD HOSTED

Zillow MCP

Search US real estate data by location or ID.

Zillow MCP connects your AI client to comprehensive US real estate data. Search for residential properties by address or zip code, find specific rental listings with current rent prices, and pull detailed historical information on any property using its unique ID.

The connectivity layer between AI and the world's software.

Vinkius sits between AI and every application. All communication passes through Vinkius Cloud via the Model Context Protocol (MCP) — with governance, observability, and security at every layer.

Your AI Connections Run Through Vinkius Cloud

The world's largest
managed MCP catalog

Vinkius is the connectivity layer where AI connects to the software your business already runs. We handle the hosting, the security, the credentials, the uptime — you get agents that actually do things.

We operate the world's largest managed MCP catalog. Major SaaS platforms, CRMs, databases, and cloud providers — running, monitored, production-ready. This MCP server is hosted and maintained by the Vinkius Cloud for AI Agents.

The agent doesn't manage credentials, doesn't manage uptime, doesn't manage security. Vinkius does.

— Architecture principle

Four Pillars of the Vinkius Runtime

01 — Security by design

Credentials stay encrypted at rest via AES-256. The AI agent never touches raw keys — they're injected into a sandboxed V8 isolate at runtime. Actions are logged, and connections have an emergency kill switch.

03 — Deterministic observability

Eight immutable metrics per endpoint: request volume, p95 latency, error rate, active connections, cost attribution. A live payload feed logs every tool call with mutation detection.

02 — Built on MCP Fusion

This MCP server was built with **MCP Fusion**, the open-source framework (Apache 2.0) that powers the entire Vinkius catalog. Schema-as-firewall strips undeclared fields, compiled PII redaction runs at zero overhead, and cryptographic lockfiles produce git-diffable audit trails.

04 — Autonomous operations

Servers are deployed, monitored, and patched autonomously. New capabilities and security patches ship weekly. Zero-downtime deployments ensure continuous availability across all managed MCP servers.

AES-256

Encryption at rest

Ed25519

PKI vault signatures

24h TTL

Ephemeral session keys

V8 Isolate

Sandboxed execution

One Token. Instant Access.

Every MCP server on Vinkius is accessed through a **Connection Token**. Tokens are generated in the cloud dashboard and produce a unique MCP endpoint URL. Paste this URL into any MCP-compatible client — no SDK required.

A single token can serve **multiple AI clients simultaneously**, or you can issue separate tokens per client for granular access control. Each token tracks its own request count, last activity timestamp, and can be individually enabled or revoked.

Security Is the Architecture

Security in Vinkius is not a feature — it's the foundation of the runtime. The gateway enforces multiple independent protection layers between AI agents and third-party APIs.

01 — Ed25519 PKI Vault

Every workspace has an Ed25519 Master Key. Session keys are generated ephemerally (24h TTL) and signed by the Master Key. Credentials never leave the vault boundary.

02 — V8 Isolate Sandboxing

Tool code runs inside isolated-vm V8 isolates with 64 MB memory caps and per-request timeouts. No filesystem access, no network access except through the SSRF-guarded fetch bridge.

03 — SSRF Guard

All outbound HTTP requests are DNS-resolved and validated before execution. Private IP ranges (10.x, 172.16-31.x, 192.168.x, AWS metadata 169.254.x) are blocked at the network layer.

05 — Cryptographic Audit Trail

Every request is signed into a SHA-256 hash chain with Ed25519 signatures. Events form a tamper-proof, SIEM-exportable forensic record.

04 — DLP & PII Redaction

A ResponseGuard pipeline intercepts every tool response. Configurable redaction patterns strip sensitive fields (emails, SSNs, card numbers) before data reaches the AI agent.

06 — Honeypot Trap System

Phantom credentials are injected into isolated environments. If a honeypot is used outside Vinkius infrastructure, the server is quarantined instantly.

Emergency Kill Switch

EU AI Act Art. 14(1)
Compliant

The kill switch is an **emergency halt** mechanism — not a simple toggle. When triggered, it executes three actions atomically:

01 — Server deactivated

The MCP server is immediately taken offline across the entire cluster.

02 — All tokens revoked

Every connection token is invalidated. Total lockout — reconnection blocked until new tokens are issued.

03 — WebSocket connections killed

Active connections terminated via Redis pubsub broadcast. Propagates to every runtime node in the cluster.

Full Visibility. Zero Guesswork.

The Vinkius cloud dashboard includes a full MCP Governance suite — real-time analytics and security controls for production AI operations.

Control Plane

KPI dashboard with request volume, latency, success rate, token consumption, and AI-generated operational briefings.

FinOps

Cost tracking per tool, payload compression savings, budget optimization signals, and consumption trends.

Firewall & DLP

PII redaction activity, sensitive data protection counters, and security event timeline.

Agent Activity

Which AI clients are connecting, how often, and what they're doing — real-time session tracking.

Tool Health

Slowest and most error-prone tools, with actionable root-cause insights and performance baselines.

Incident Log

Error trends, failure rates, status-code breakdowns, and forensic audit trail access.

Zillow MCP

3 tools available

Cloud-hosted on Vinkius

This MCP lets you talk to Zillow like a real agent does. You can ask your AI client things like, 'What are the average prices for condos in Brooklyn?' or 'Find me three rentals under \$2,000 with two bathrooms.' It goes beyond simple searching by giving you full property profiles: everything from square footage and lot size to price history and tax details.

Whether you're a first-time buyer comparing neighborhoods or an agent needing quick listing data, this MCP pulls the structured information directly. You don't have to click through dozens of tabs on Zillow's website; your AI client handles it for you. Because Vinkius hosts this connection, you simply plug in your preferred client—whether that's Cursor, Claude, or VS Code—and start asking questions right away.

Core Capabilities

01 — Search residential properties by area

Locate homes across the US using address, city, state, or zip code.

02 — Find available rental listings

Generate a list of rental units, including current rent prices and key property specs.

03 — Retrieve deep property details by ID

Get an exhaustive profile for one specific home, including price changes and tax records.

One Click on Vinkius — From Prompt to Execution

Available at vinkius.com/mcp/zillow — connect your AI agent in three steps.

- 01 First, subscribe to the Zillow MCP on Vinkius and enter your unique Zillow Bridge API key.
- 02 Next, tell your AI client what you need—for example, 'Find single-family homes built after 2010 in Austin.'
- 03 Your agent executes the request using the underlying tools and returns structured data including price, bedrooms, bathrooms, and square footage.

The bottom line is that your AI client turns complex real estate research into a simple conversation.

Built For

Anyone who deals with property data needs this. Home buyers waste hours cross-referencing listing sites and local county records. Real Estate Agents need instant access to historical pricing and detailed specs without logging into multiple portals. Renters can finally get a clear picture of market availability.

Real Estate Agent

Uses the MCP to pull specific property details using ``get_property_by_id`` or run neighborhood searches with ``search_property`` to quickly prepare client packets.

Home Buyer / Renter

Asks for targeted listings, like 'Show me rental units in zip code 90210,' or 'Compare single-family homes vs. condos in this area' using ``get_rental_property`` and ``search_property``.

Real Estate Investor

Uses the MCP to compare property features, track potential price changes across different zip codes, or gather data for market trend reports.

What Changes When You Connect

-
- 01** Saves time on property research. Instead of manually checking multiple sites, your agent uses `search_property` to pull general neighborhood stats in one prompt.

 - 02** Gets full context on properties. Need to know if a house's price has dipped over the last year? Use `get_property_by_id` to see the complete pricing history and tax records instantly.

 - 03** Streamlines rental searches. The MCP runs targeted queries via `get_rental_property`, giving you current rent estimates, bed counts, and amenities for whole areas at once.

 - 04** Compares listings easily. You can search multiple properties in a single conversation, letting your AI client compare features like lot size or year built across different homes.

 - 05** Directly addresses pain points. It lets you ask complex questions—like 'How many 3-bedroom houses were built pre-1950 in this zip code?'—and get actionable data back.
-

Real-World Applications

Assessing a neighborhood's potential value

A buyer asks, 'What are the typical price ranges for single-family homes versus townhouses in this zip code?' The agent uses `search_property` to pull data on both types of housing, letting the client compare overall market density and pricing structure.

Finding temporary housing options

A client needs a short-term rental while their house is renovated. The agent runs `get_rental_property` for the target area, filtering by necessary amenities and listing details like bathrooms and square footage.

Vetting a potential investment property

An investor finds an address online. Instead of calling Zillow support, they use `get_property_by_id` to get immediate access to the full price history, tax data, and structural features for due diligence.

Comparing market segments

An agent wants to show a client the difference between buying and renting in one spot. They first run `search_property` for sales data and then follow up with `get_rental_property` to give a complete picture of local housing options.

Patterns to Avoid

Asking for general market advice

✗ AVOID

Prompting the agent: 'Should I invest in real estate right now?' The MCP will fail because it only returns structured, factual data, not opinions or generalized economic forecasts.

✓ INSTEAD

To get actionable facts, use `search_property` to check current pricing and listing status for specific locations. This tells you what the market *is*, not what it *will be*.

Using only an address without IDs

✗ AVOID

Telling the agent: 'Get me all details about 123 Main Street.' If the system needs a unique identifier, it won't pull the full data set.

✓ INSTEAD

For maximum detail, you must provide the property ID. Use `get_property_by_id` and include that specific number to guarantee access to price history, tax info, and photos.

Mixing residential and commercial searches

✗ AVOID

Asking: 'Find me office space in downtown Chicago.' The Zillow MCP is designed only for residential and rental listings. It cannot handle non-housing types of properties.

✓ INSTEAD

Stick to the core function. Use `search_property` or `get_rental_property` for any request concerning homes, apartments, or houses.

The Right Fit

Use this MCP if your task requires structured, address-based data about residential and rental housing units across the US. If you need to compare features like square footage, year built, or price history on a specific ID, this is perfect because of `get_property_by_id`. It's ideal for agents and buyers who rely on factual listing details.

Don't use this if your goal is general economic advice or creative writing. If you just want to know 'Is the housing market bad?'—this won't answer that because it only retrieves data, not analysis. For those situations, you need a dedicated financial modeling tool instead.

Manually comparing property listings is a time sink.

Think about the old way: You open Zillow on your laptop, then Google Maps for the neighborhood boundaries. You copy zip codes into one spreadsheet, and manually paste listing prices from three different tabs just to compare if a house meets basic criteria. It's clicking, switching windows, and doing a lot of tedious data aggregation.

With this MCP, you simply tell your agent what you need—'Compare all 3-bedroom condos in the 90210 area with less than \$1.5 million.' Your AI client handles the multi-step search automatically, delivering a clean list that already has price, beds, and baths laid out for you.

Get detailed insights using `get_property_by_id`

The biggest time drain is realizing a property looked great, but then you need to know if the price history makes sense. You end up navigating deep into separate tax and feature tabs just to find one data point about how long it was listed or what its original lot size was.

Now, by using `get_property_by_id`, your agent pulls all that context—price changes, features, photos, and taxes—into a single report. You get the full story on the property without leaving the chat window.

Zillow MCP with 3 Tools

Use these tools to search US real estate listings, retrieve property details by ID, and find current rental units using natural conversation.

#	TOOL	DESCRIPTION
01	<code>get_property_by_id</code>	Retrieves comprehensive details on a specific property using its unique identification number, including price history and tax info.
02	<code>get_rental_property</code>	Searches for current rental listings and returns key data like rent prices, bedrooms, bathrooms, and square footage.
03	<code>search_property</code>	Finds residential properties across a geographical area, giving details on price, size, lot dimensions, and construction year.

See It in Action

Real prompts you can use once this MCP is connected to your AI agent through Vinkius Cloud.

U Search for properties in New York, NY.

Found 25 properties in New York, NY. Price range: \$450K - \$5.2M. Types: Condos, Townhouses, Single Family. Each with address, price, bedrooms, bathrooms and square footage.

U Find rental properties in Los Angeles, CA.

Found 20 rental listings in Los Angeles, CA. Rent range: \$1,800 - \$8,500/month. Types: Apartments, Houses, Condos. Each with rent price, bedrooms, bathrooms and square footage.

U Get details for property ID 12345.

Property 12345: 123 Oak Street, Los Angeles, CA 90001. Price: \$1,250,000. 4 bed, 3 bath, 2,400 sqft. Built 2015. Single Family. Lot size: 5,200 sqft.

Frequently Asked Questions

01 Can Zillow MCP find me rental properties in Los Angeles?

Yes. Use `get_rental_property` to search for current listings in any area. The tool returns key details like rent price, number of bedrooms, and bathroom counts.

02 How do I get the full history of one property using Zillow MCP?

You must use `get_property_by_id` and provide the exact ID number. This tool pulls detailed records including price changes, tax information, and photos.

03 Does Zillow MCP only search by zip code?

No. You can instruct your agent to search residential properties using `search_property` by address, city, state, or a full zip code range.

04 Is the data from Zillow MCP real-time?

The data provided is based on current listing information available through the API. Always verify final contract details with the seller, but the tool provides up-to-date market snapshots.

05 What if I want to compare two different types of homes?

You can combine calls or ask your agent to run both `search_property` (for sales) and `get_rental_property` (for rentals) in a single request for comparison.
